SERVICE RULES

1. Use genuine Honda or Honda-recommended parts and lubricants or their equivalents. Parts that don't meet Honda's design specifications may cause damage to the motorcycle.
2. Use the special tools designed for this product to avoid damage and incorrect assembly.
3. Use only metric tools when servicing the motorcycle. Metric bolts, nuts and screws are not interchangeable with English fasteners.
4. Install new gaskets, O-rings, cotter pins, and lock plates when reassembling.
5. When tightening bolts or nuts, begin with the larger diameter or inner bolt first. Then tighten to the specified torque diagonally in incremental steps unless a particular sequence is specified.
6. Clean parts in cleaning solvent upon disassembly. Lubricate any sliding surfaces before reassembly.
7. After reassembly, check all parts for proper installation and operation.
8. Route all electrical wires as shown on pages 1-18 through 1-40, Cable & Harness Routing.

MODEL IDENTIFICATION

EMISSION CONTROL SYSTEMS

The U.S. Environmental Protection Agency, Transport Canada and California Air Resources Board (CARB) require manufacturers to certify that their motorcycles comply with applicable exhaust emissions standards during their useful life, when operated and maintained according to the instructions provided, and that motorcycles built after January 1, 1983 comply with applicable noise emission standards for one year or 6,000 km (3,730 miles) after the time of sale to the ultimate purchaser, when operated and maintained according to the instructions provided. Compliance with the terms of the Distributor's Limited Warranty for Honda Motorcycle Emission Control Systems is necessary in order to keep the emissions system warranty in effect.

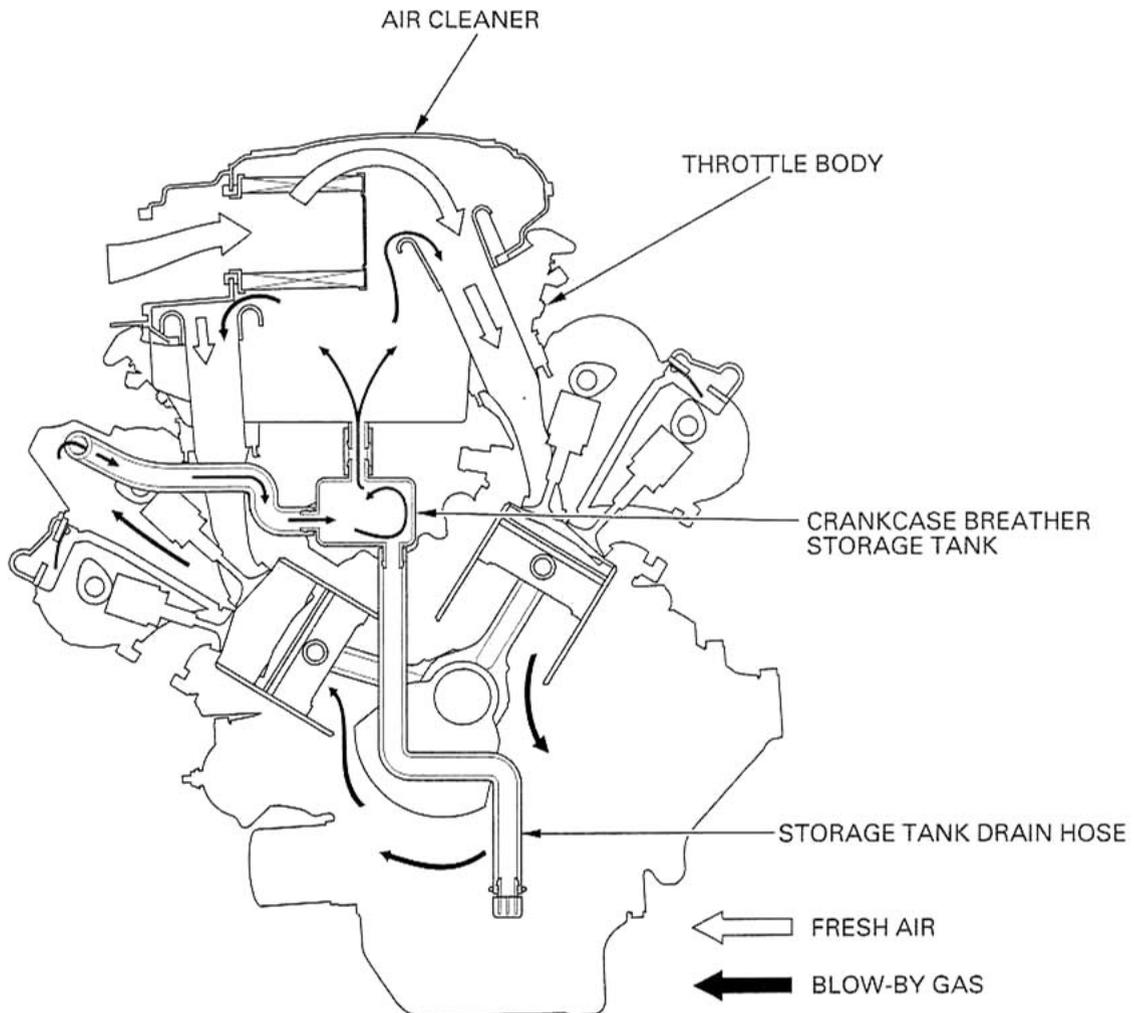

SOURCE OF EMISSIONS

The combustion process produces carbon monoxide, oxides of nitrogen and hydrocarbons. Control of oxides of nitrogen and hydrocarbons is very important because, under certain conditions, they react to form photochemical smog when subjected to sunlight. Carbon monoxide does not react in the same way, but it is toxic.

Honda Motor Co., Ltd. utilizes PGM-FI as well as pulse secondary air injection (PAIR) system, to reduce carbon monoxide and hydrocarbons.

CRANKCASE EMISSION CONTROL SYSTEM

The engine is equipped with a closed crankcase system to prevent discharging crankcase emissions into the atmosphere. Blow-by gas is returned to the combustion chamber through the air cleaner and throttle body.

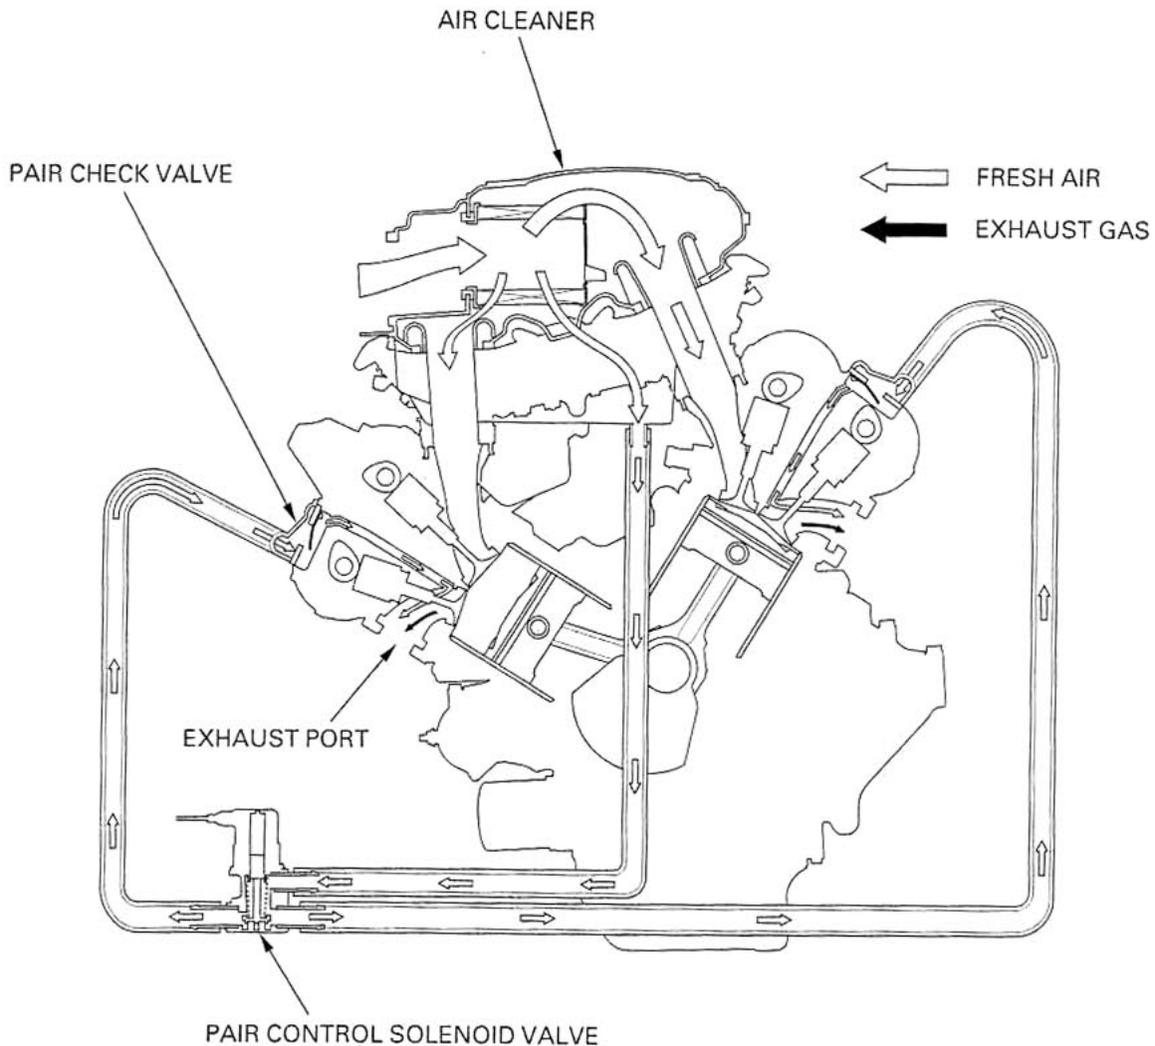

GENERAL INFORMATION

EXHAUST EMISSION CONTROL SYSTEM (PULSE SECONDARY AIR INJECTION SYSTEM)

The exhaust emission control system consists of a secondary air supply system which introduces filtered air into the exhaust gases in the exhaust port. Fresh air is drawn into the exhaust port whenever there is a negative pressure pulse in the exhaust system. This charge of fresh air promotes burning of the unburned exhaust gases and changes a considerable amount of hydrocarbons and carbon monoxide into relatively harmless carbon dioxide and water vapor.

This model has the pulse secondary air injection (PAIR) check valves and the PAIR control solenoid valve which is controlled by the engine control module (ECM). PAIR check valve prevents reverse air flow through the system. The ECM signals the PAIR control solenoid valve in accordance with the running conditions (engine coolant temperature, intake air temperature, throttle position, manifold absolute pressure and engine revolution), which then cuts off the supply of fresh air.

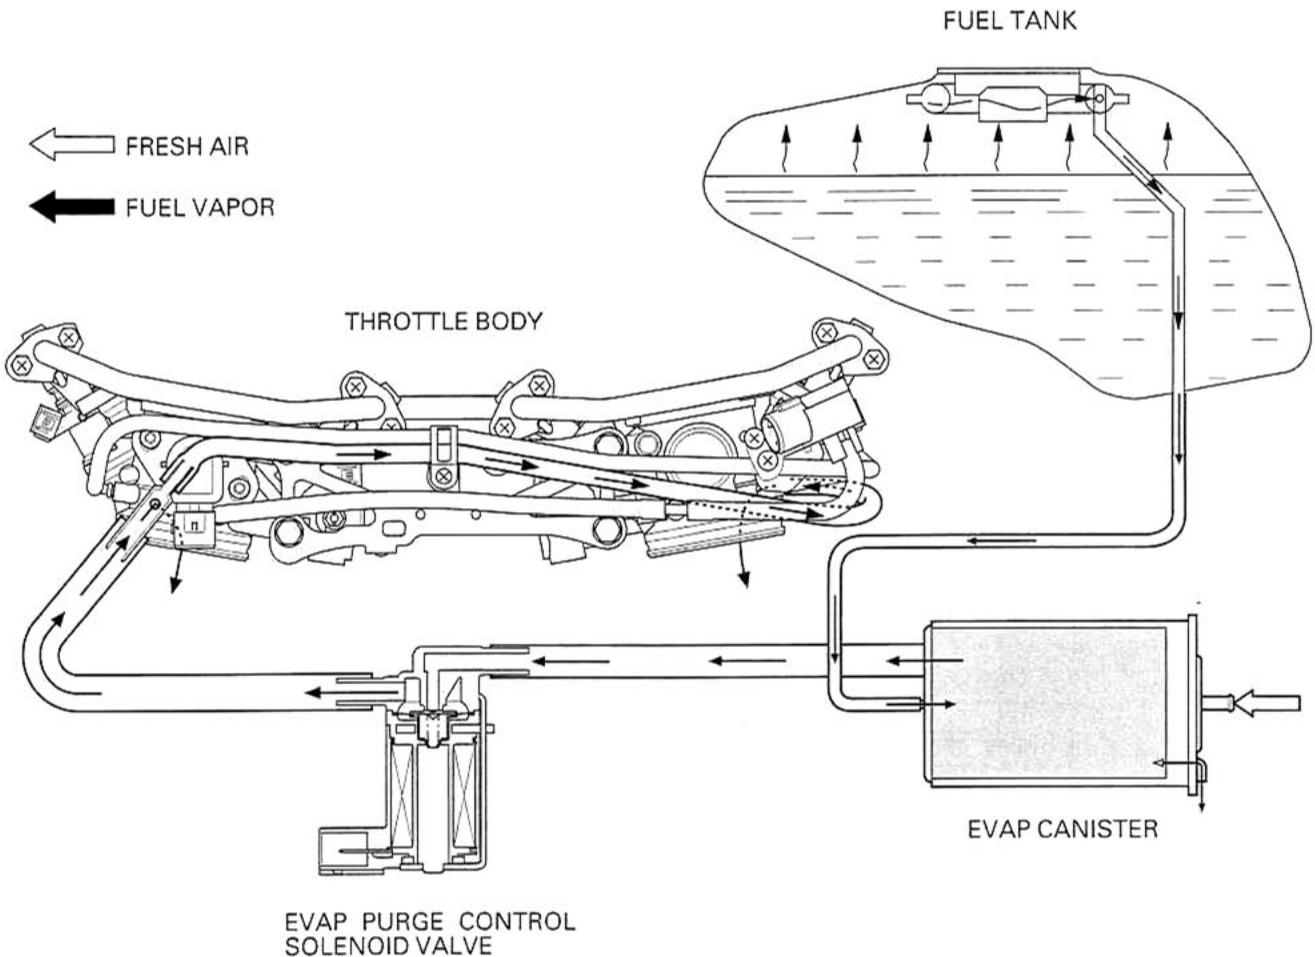

No adjustment to the pulse secondary air injection system should be made: although, periodic inspection of the components is recommended.

EVAPORATIVE EMISSION CONTROL SYSTEM (California type only)

This model complies with CARB evaporative emission requirements.

Fuel vapor from the fuel tank is routed into the evaporative emission (EVAP) canister where it is adsorbed and stored while the engine is stopped. When the engine is running and the EVAP purge control valve is open, fuel vapor in the EVAP canister is drawn into the engine through the throttle body.

NOISE EMISSION CONTROL SYSTEM

TAMPERING WITH THE NOISE CONTROL SYSTEM IS PROHIBITED: U.S. federal law prohibits or Canadian provincial law may prohibit the following acts or the causing thereof: (1) The removal or rendering inoperative by any person, other than for purposes of maintenance, repair or replacement, of any device or element of design incorporated into any new vehicle for the purpose of noise control prior to its sale or delivery to the ultimate purchaser or while it is in use; (2) the use of the vehicle after such device or element of design has been removed or rendered inoperative by any person.

AMONG THOSE ACTS PRESUMED TO CONSTITUTE TAMPERING ARE THE ACTS LISTED BELOW:

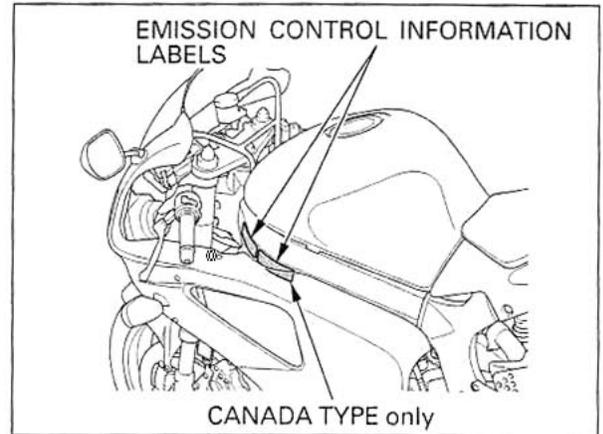

1. Removal of or puncturing of the muffler, baffles, header pipes or any other component which conduct exhaust gases.
2. Removal of, or puncturing of any part of the intake system.
3. Lack of proper maintenance.
4. Replacing any moving parts of the vehicle, or parts of the exhaust or intake system, with parts other than those specified by the manufacturer.

GENERAL INFORMATION

EMISSION CONTROL INFORMATION LABELS

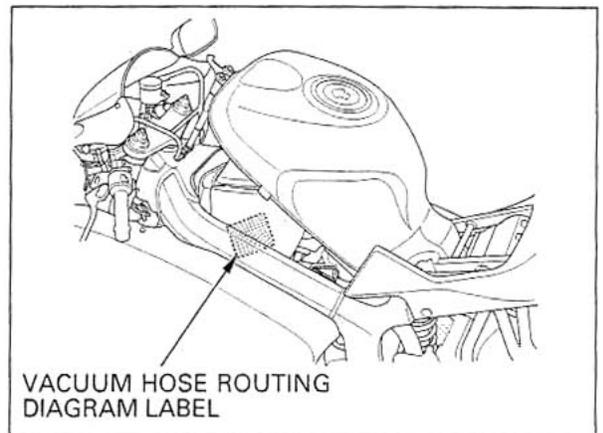

An Emission Control Information Label is located on the left side of the frame near the steering head as shown.

It gives base tune-up specifications.

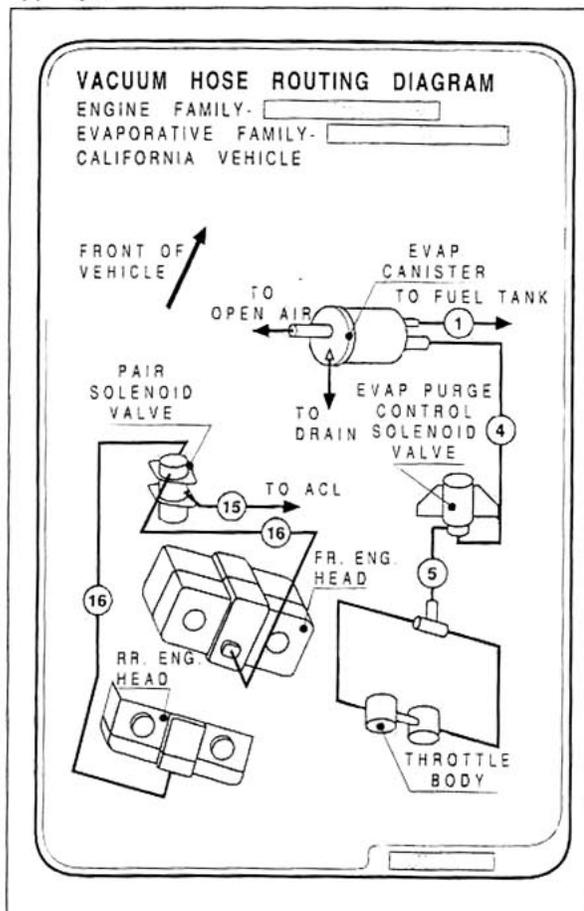

VACUUM HOSE ROUTING DIAGRAM LABEL (California Type Only)

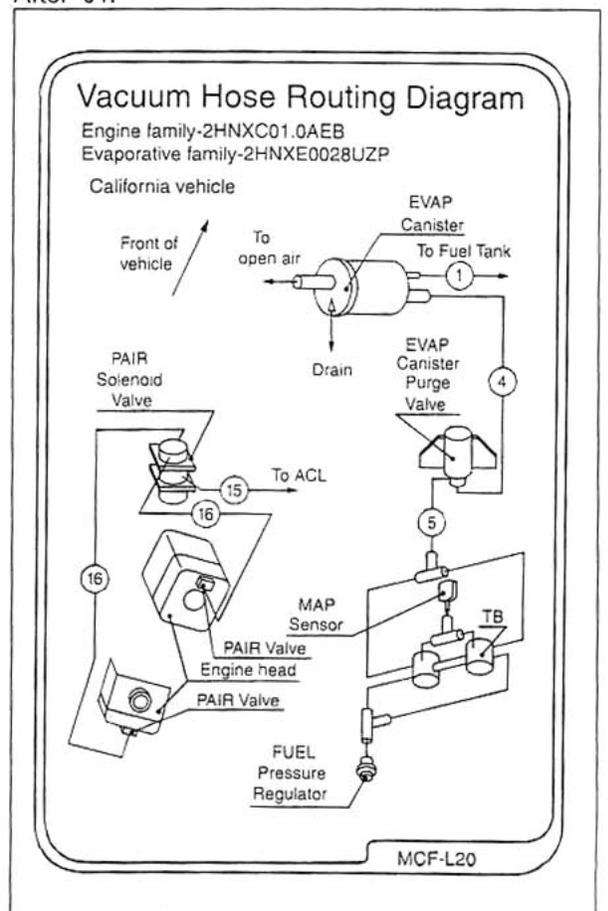

The Vacuum Hose Routing Diagram Label is located on the left side of the air cleaner housing as shown. The fuel tank must be raised to read it (page 3-4).

SERVICE INFORMATION

GENERAL

WARNING

Removing the radiator cap while the engine is hot can allow the coolant to spray out, seriously scalding you. Always let the engine and radiator cool down before removing the radiator cap.

NOTICE

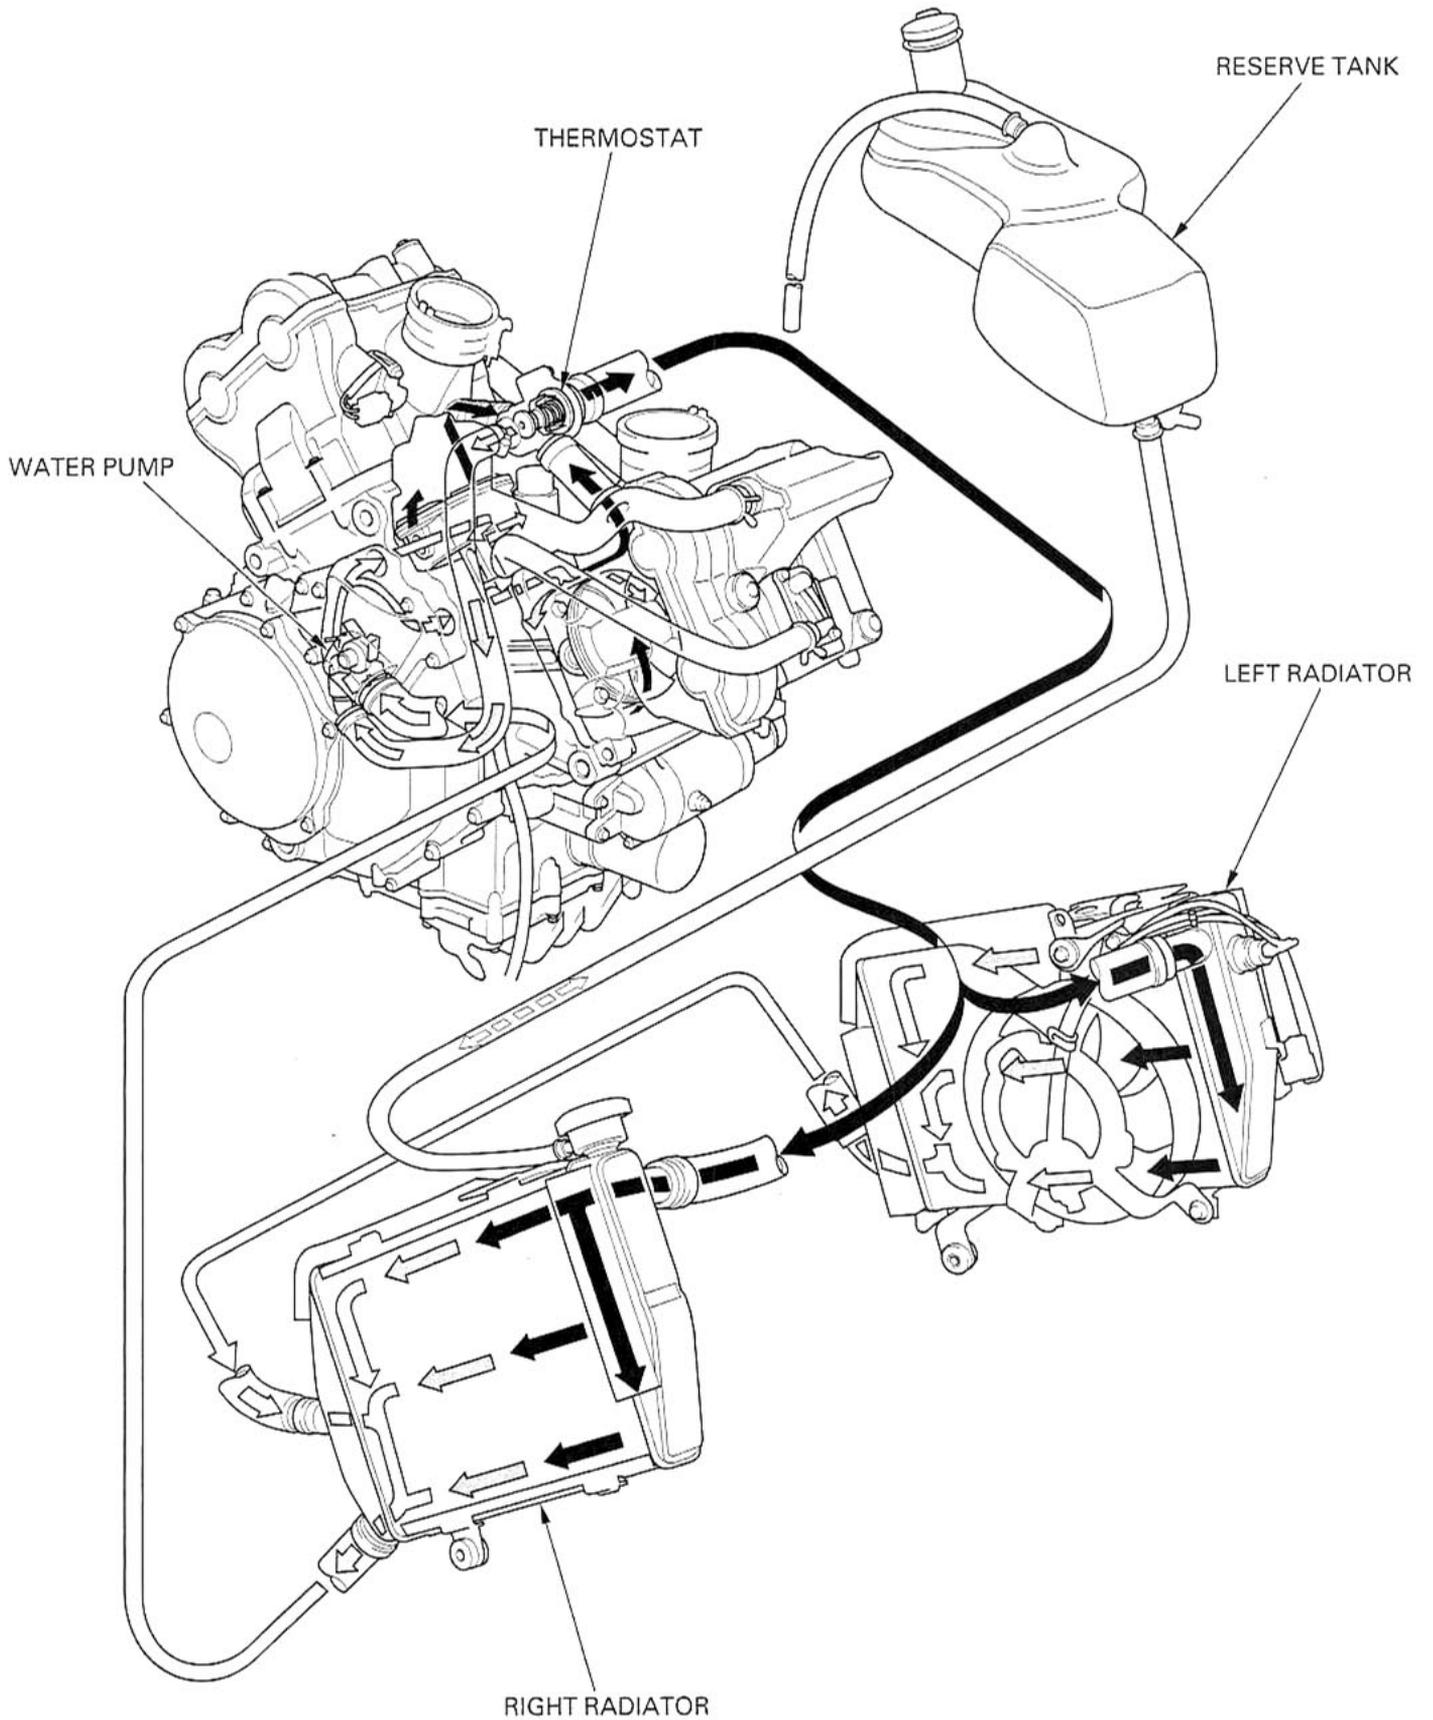

Using coolant with silicate corrosion inhibitors may cause premature wear of water pump seals or blockage of radiator passages. Using tap water may cause engine damage.

- Add coolant at the reserve tank. Do not remove the radiator cap except to refill or drain the system.
- All cooling system service can be done with the engine in the frame.
- Avoid spilling coolant onto painted surfaces.
- After servicing the system, check for leaks with a cooling system tester.

COOLING SYSTEM

RADIATOR CAP/SYSTEM PRESSURE INSPECTION

Before installing the cap in the tester, wet the sealing surfaces. Pressure test the radiator cap using the tester. Replace the radiator cap if it does not hold pressure, or if relief pressure is too high or too low. It must hold the specified pressure for at least 6 seconds.

RADIATOR CAP RELIEF PRESSURE:

108–137 kPa (1.1–1.4 kgf/cm², 16–20 psi)

Excessive pressure can damage the cooling system components. Do not exceed 137 kPa (1.4 kgf/cm², 20 psi). Pressurize the radiator, engine and hoses using the tester, and check for leaks. Repair or replace components if the system will not hold the specified pressure for at least 6 seconds.

COOLANT REPLACEMENT

PREPARATION

NOTICE

Using coolant with silicate corrosion inhibitors may cause premature wear of water pump seals or blockage of radiator passage. Using tap water may cause engine damage.

NOTE:

- The effectiveness of coolant decreases with the accumulation of rust or if there is a change in the mixing proportion during usage. Therefore, for best performance change the coolant regularly as specified in the maintenance schedule.

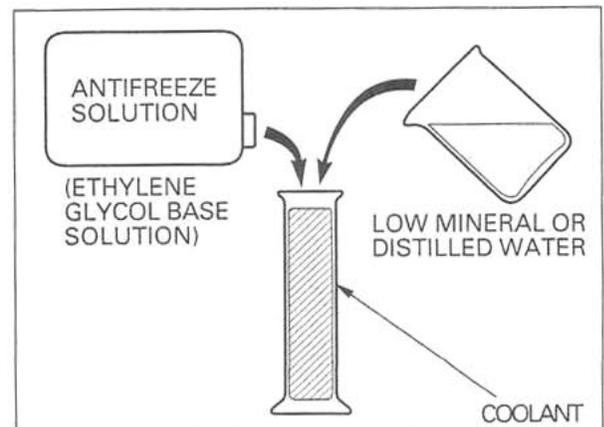

Mix only distilled low mineral water with the recommended antifreeze.

RECOMMENDED ANTIFREEZE:

Pro Honda HP Coolant or an equivalent high quality ethylene glycol antifreeze containing silicate-free corrosion inhibitors

SERVICE INFORMATION

GENERAL

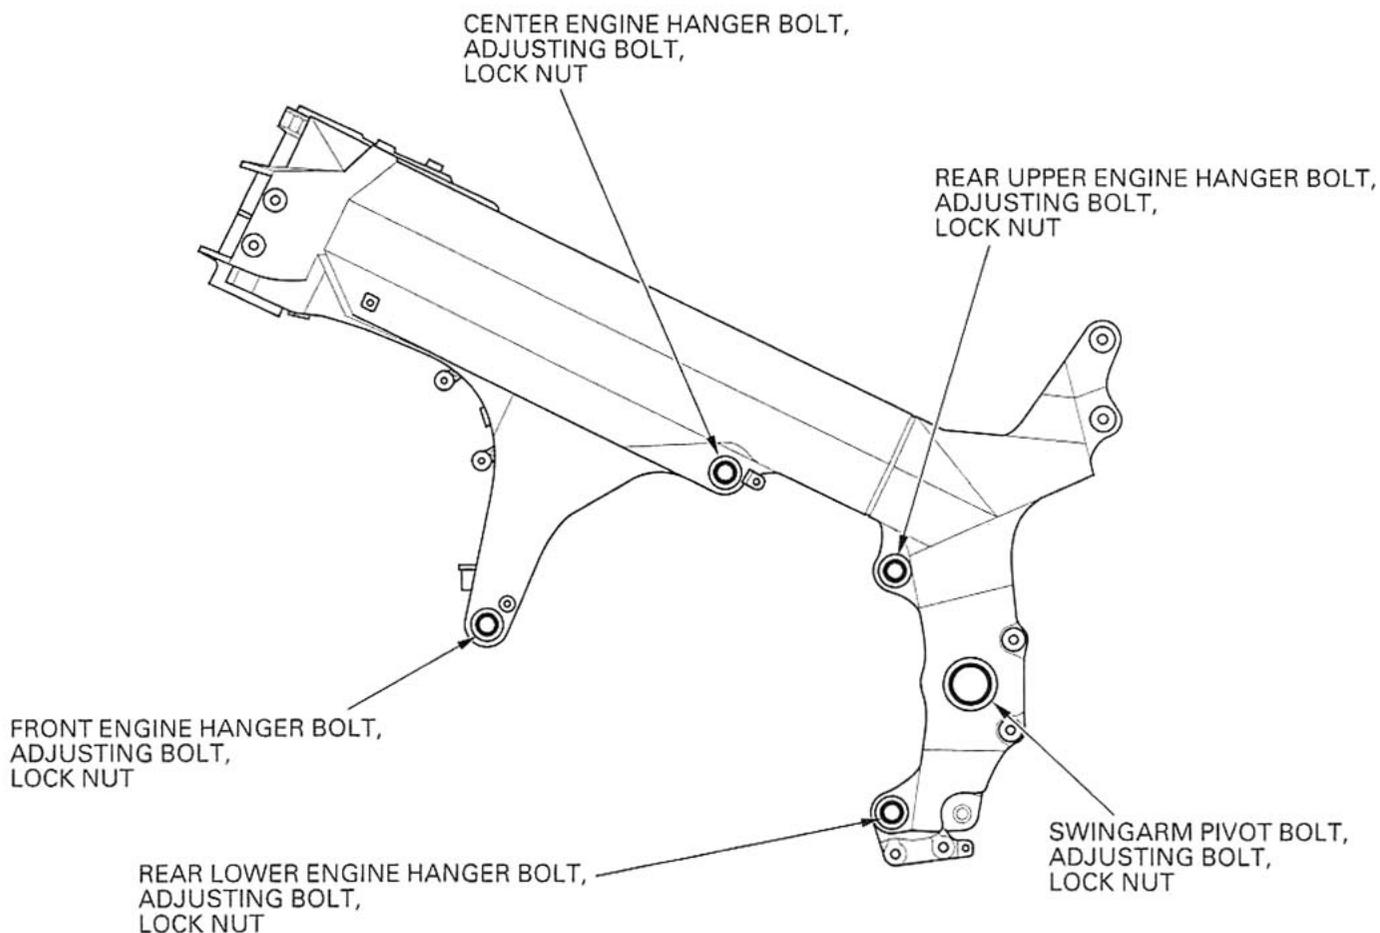

- A hoist or equivalent is required to support the motorcycle when removing and installing the engine.
- A floor jack or other adjustable support is required to support and maneuver the engine.

NOTICE

Do not use the oil filter as a jacking point.

- When using the lock nut wrench for the adjusting bolt lock nut, use a 20-inch long deflecting beam type torque wrench. The lock nut wrench increases the torque wrench's leverage, so the torque wrench reading will be less than the torque actually applied to the lock nut. The specification given is the actual torque applied to the lock nut, not the reading on the torque wrench. Do not overtighten the lock nut. The specification later in the text gives both actual and indicated.
- The following components require engine removal for service:
 - transmission (section 11)
 - crankshaft/piston/cylinder (section 12)
- When installing the engine, be sure to tighten the engine mounting fasteners to the specified torque in the specified sequence. If you make a mistake with the tightening torque or sequence, loosen all mounting fasteners, then tighten them again to the specified torque in the correct sequence.

 - Burned or bent valves
 - Incorrect valve timing
 - Broken valve spring
 - Uneven valve seating
- Cylinder head
 - Leaking or damaged cylinder head gasket
 - Warped or cracked cylinder head
 - Loose spark plug
- Cylinder/piston (section 12)

Compression too high

CYLINDER COMPRESSION

Warm up the engine to normal operating temperature.

Stop the engine and remove the spark plug caps and spark plugs (page 3-7).

Install the compression gauge into the spark plug hole.

Disconnect the fuel pump 3P (black) connector.

Shift the transmission in neutral.

Open the throttle all the way and crank the engine with the starter motor until the gauge reading stops rising. The maximum reading is usually reached within 4–7 seconds.

COMPRESSION PRESSURE:

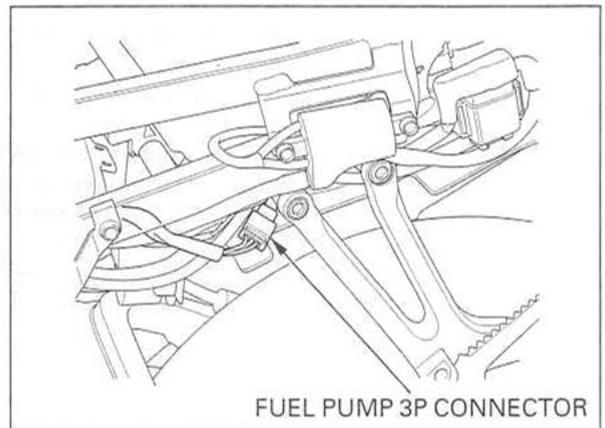

1,216 kPa (12.4 kgf/cm², 176 psi)
at 350 rpm

Low compression can be caused by:

- blown cylinder head gasket
- improper valve adjustment
- valve leakage
- worn piston ring or cylinder

High compression can be caused by:

- carbon deposits in combustion chamber or on piston head

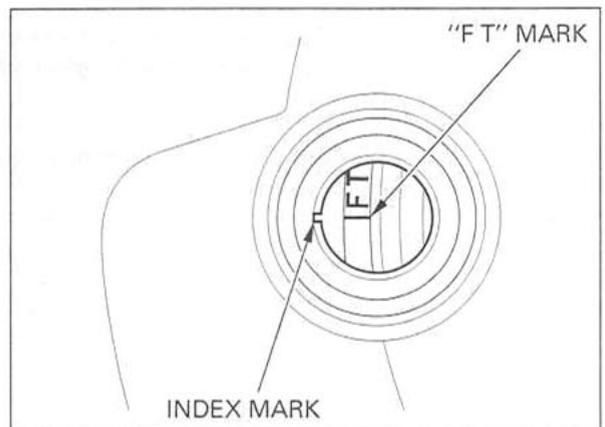

CAMSHAFT REMOVAL

Remove the cylinder head cover, timing hole cap and crankshaft hole cap (page 3-10).

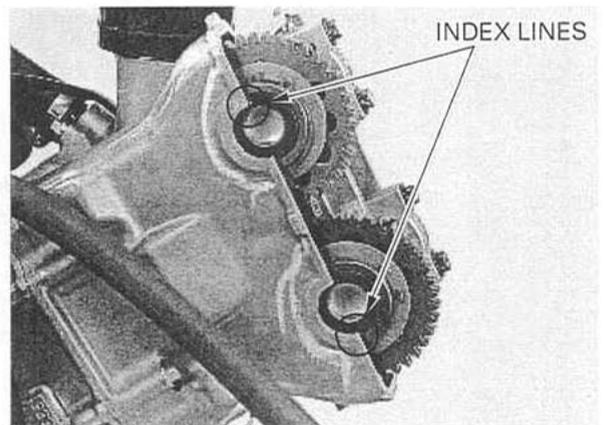

Front cylinder:

Rotate the crankshaft counterclockwise and align the "F T" mark on the flywheel with the index mark on the left crankcase cover.

Check that the index lines on the front cylinder camshafts are flush with the cylinder head surface and facing outward as shown.

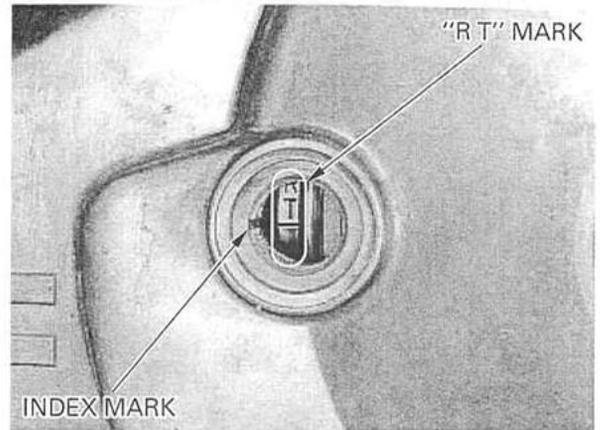

If the index lines are facing inward, rotate the crankshaft counterclockwise 360° (1 full turn) and align the "F T" mark with the index mark.

CYLINDER HEAD/VALVE

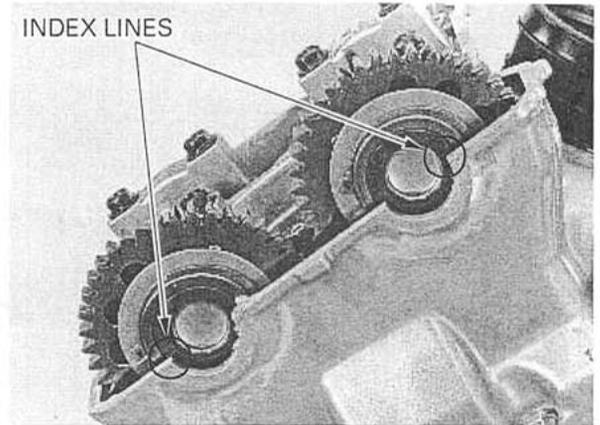

Rear cylinder:

Rotate the crankshaft counterclockwise and align the "R T" mark on the flywheel with the index mark on the left crankcase cover.

The index lines on the rear cylinder camshafts must be flush with the cylinder head surface and facing outward as shown.

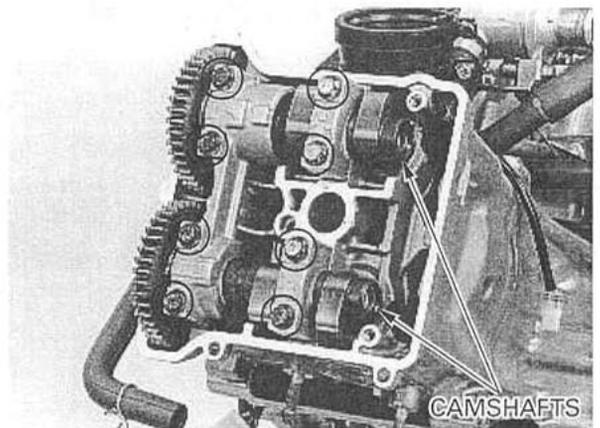

If the index lines are facing inward, rotate the crankshaft counterclockwise 360° (1 full turn) and align the "R T" mark with the index mark.

Remove the camshaft holder bolts, camshaft holders, dowel pins and camshafts.

NOTE:

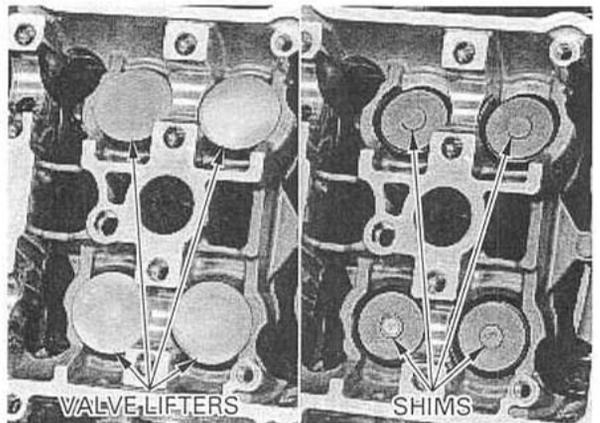

- Do not forcibly remove the dowel pins from the camshaft holders.

Remove the valve lifters and shims.

NOTE:

- Be careful not to damage the valve lifter bore.
- Shims may stick to the inside of the valve lifters. Do not allow the shims to fall into the crankcase.
- Mark all valve lifters and shims to ensure correct reassembly in their original locations.
- The valve lifter can be easily removed with a valve lapping tool or magnet.

Stop the engine and remove the spark plug caps and spark plugs (page 3-7).

Install the compression gauge into the spark plug hole.

Disconnect the fuel pump 3P (black) connector.

Shift the transmission in neutral.

Open the throttle all the way and crank the engine with the starter motor until the gauge reading stops rising. The maximum reading is usually reached within 4–7 seconds.

- improper valve adjustment
- valve leakage
- worn piston ring or cylinder

High compression can be caused by:

- carbon deposits in combustion chamber or on piston head

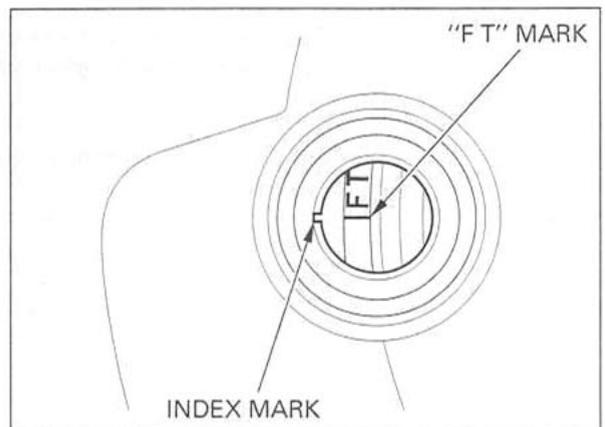

CAMSHAFT REMOVAL

Remove the cylinder head cover, timing hole cap and crankshaft hole cap (page 3-10).

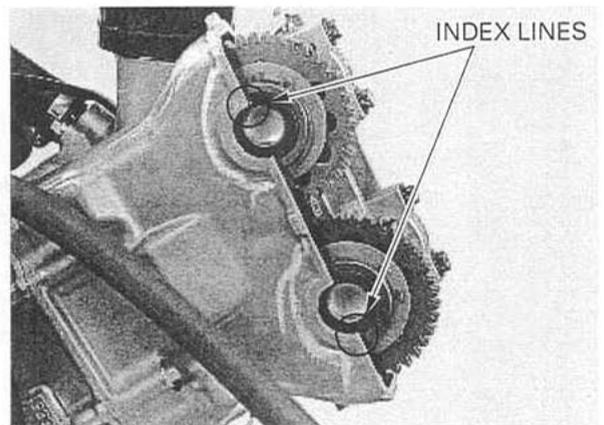

Front cylinder:

Rotate the crankshaft counterclockwise and align the "F T" mark on the flywheel with the index mark on the left crankcase cover.

Check that the index lines on the front cylinder camshafts are flush with the cylinder head surface and facing outward as shown.

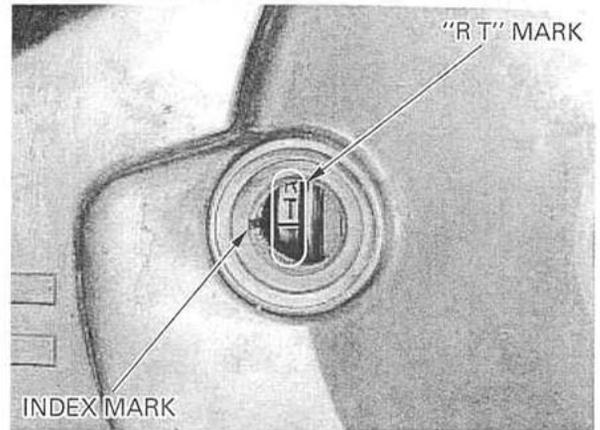

If the index lines are facing inward, rotate the crankshaft counterclockwise 360° (1 full turn) and align the "F T" mark with the index mark.

CYLINDER HEAD/VALVE

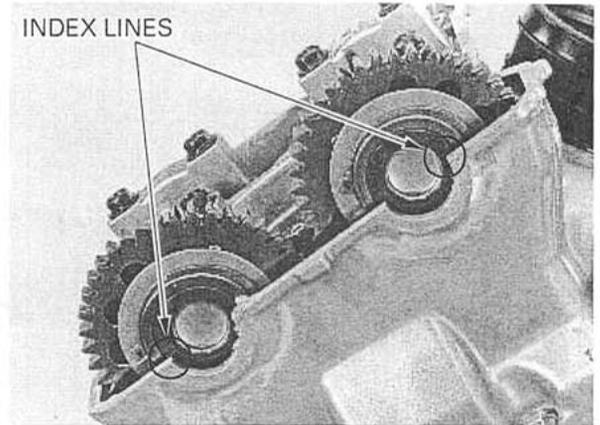

Rear cylinder:

Rotate the crankshaft counterclockwise and align the "R T" mark on the flywheel with the index mark on the left crankcase cover.

The index lines on the rear cylinder camshafts must be flush with the cylinder head surface and facing outward as shown.

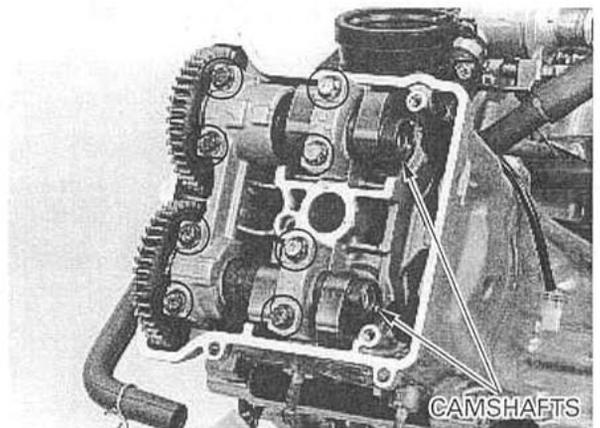

If the index lines are facing inward, rotate the crankshaft counterclockwise 360° (1 full turn) and align the "R T" mark with the index mark.

Remove the camshaft holder bolts, camshaft holders, dowel pins and camshafts.

NOTE:

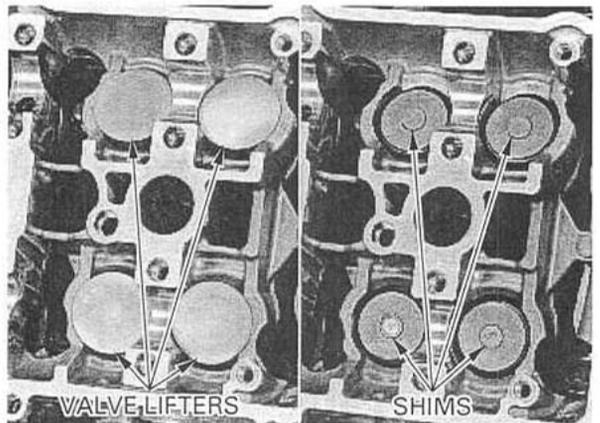

- Do not forcibly remove the dowel pins from the camshaft holders.

Remove the valve lifters and shims.

NOTE:

- Be careful not to damage the valve lifter bore.
- Shims may stick to the inside of the valve lifters. Do not allow the shims to fall into the crankcase.

SERVICE INFORMATION

GENERAL

- The clutch system can be serviced with the engine in the frame.
- DOT 4 brake fluid is used for the hydraulic clutch and is referred to as clutch fluid in this section. Do not use other types of fluid as they are not compatible.
- Spilled clutch (brake) fluid will severely damage the plastic parts and painted surfaces. It is also harmful to some rubber parts. Be careful whenever you remove the reservoir cap; make sure the reservoir is horizontal first.
- Never allow contaminants (dirt, water, etc.) to get into an open reservoir.
- Once the hydraulic system has been opened, the system must be bled.
- Always use fresh DOT 4 brake fluid from a sealed container when servicing the system. Do not mix different types of fluid as they may not be compatible.
- Engine oil viscosity and level, and the use of oil additives have an effect on clutch disengagement. Oil additives of any kind are specifically not recommended. When the clutch does not disengage or the motorcycle creeps with the clutch disengaged, inspect the engine oil viscosity and level before servicing the clutch system.

- Discs worn
- Weak clutch spring

CLUTCH FLUID REPLACEMENT/ AIR BLEEDING

CLUTCH FLUID DRAINING

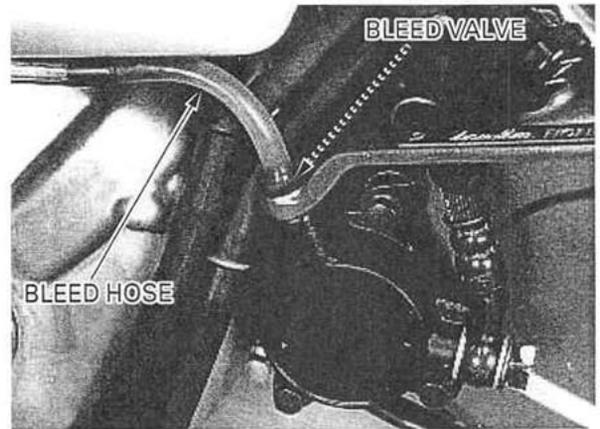

Do not allow foreign material to enter the system when filling the reservoir.

Turn the handlebar to the right until the reservoir is level, and remove the stopper plate, reservoir cap, set plate and diaphragm.

Connect a bleed hose to the clutch slave cylinder bleed valve.

Loosen the bleed valve and pump the clutch lever until fluid stops flowing out of the bleed valve.

CLUTCH FLUID FILLING/BLEEDING

Connect a commercially available brake bleeder to the bleed valve of the clutch slave cylinder at the position as shown.

Pump the brake bleeder and loosen the bleed valve. If an automatic refill system is not used, add brake fluid when the fluid level in the reservoir is low.

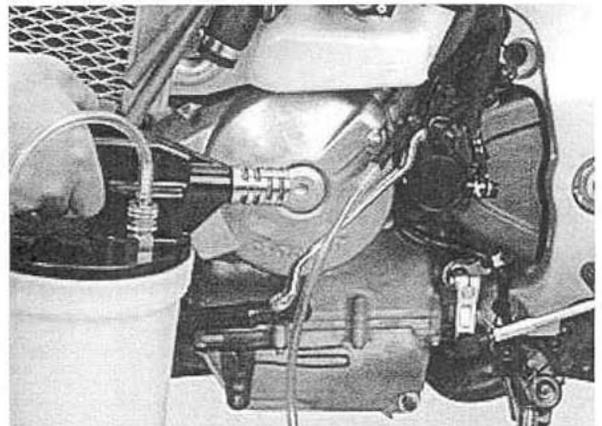

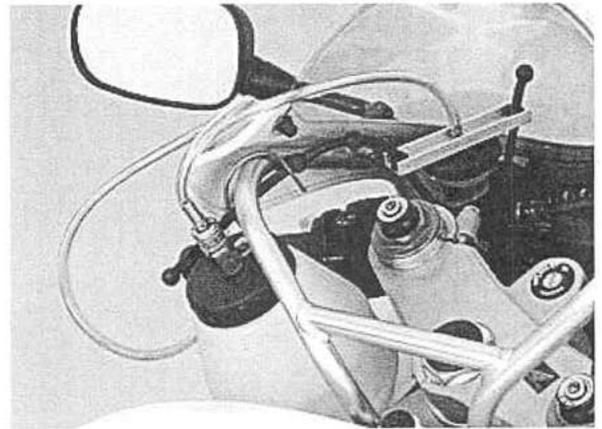

Repeat above procedure until sufficient amount of the fluid flows out from the bleed valve. Close the bleed valve.

NOTE:

- Check the fluid level often while bleeding the clutch to prevent air from being pumped into the system.
- When using a brake bleeding tool, follow the manufacturer's operating instructions.

If air is entering the bleeder from around the bleed valve threads, seal the threads with teflon tape.

Repeat the above procedures until new fluid comes out of the bleed valve and air bubbles do not appear in the plastic hose.

If a brake bleeder is not available, use the following procedure:
 Pressurize the system with the clutch lever until lever resistance is felt.

Connect a bleed hose to the bleed valve and bleed the system as follows:

1. Squeeze the clutch lever, open the bleed valve 1/2 turn and then close it.

NOTE:

TROUBLESHOOTING

Compression too low, hard starting or poor performance at low speed

- Leaking cylinder head gasket
- Worn, stuck or broken piston ring
- Worn or damaged cylinder and piston

Compression too high, overheating or knocking

- Excessive carbon built-up on piston head or combustion chamber

Excessive smoke

- Worn cylinder, piston or piston rings
- Improper installation of piston rings
- Scored or scratched piston or cylinder wall

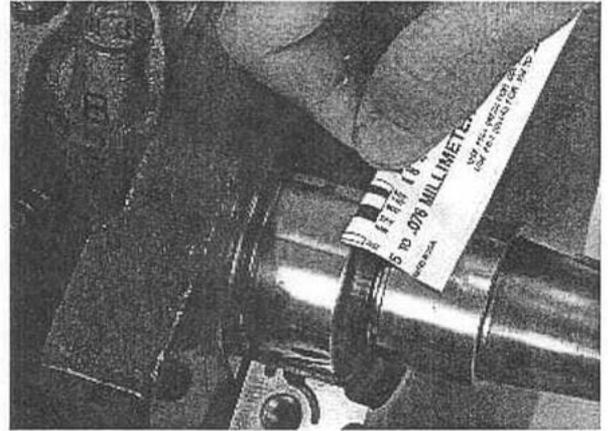

Abnormal noise

- Worn piston pin or piston pin hole
- Worn connecting rod small end
- Worn cylinder, piston or piston rings
- Worn main journal bearings
- Worn crankpin bearings

Remove the lower crankcase and measure the compressed plastigauge at its widest point on each main journal to determine the oil clearance.

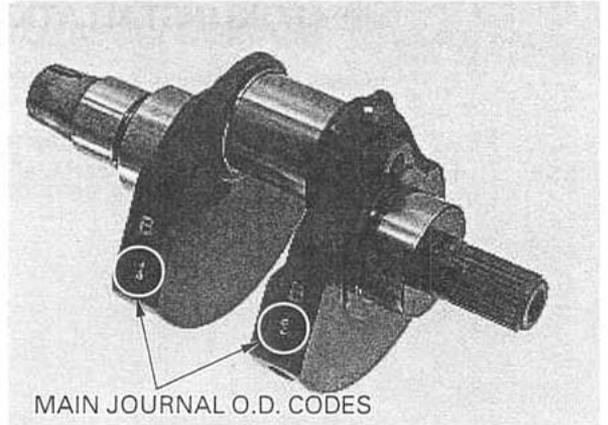

SERVICE LIMIT: 0.048 mm (0.0019 in)

If the oil clearance exceeds the service limit, select the correct replacement bearings.

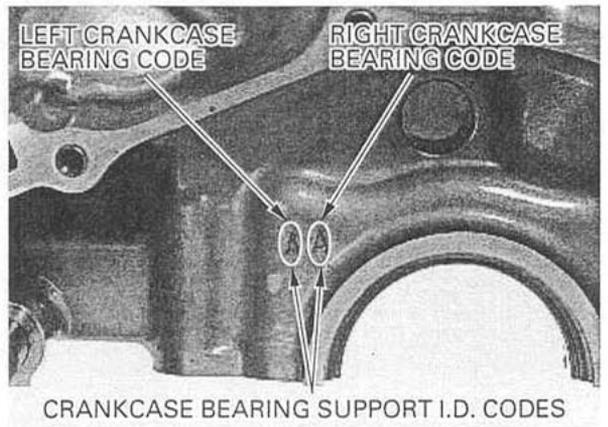

BEARING SELECTION

Number 1, 2 or 3 on the crank weight is the code for the main journal O.D. Record the main journal O.D. code numbers.

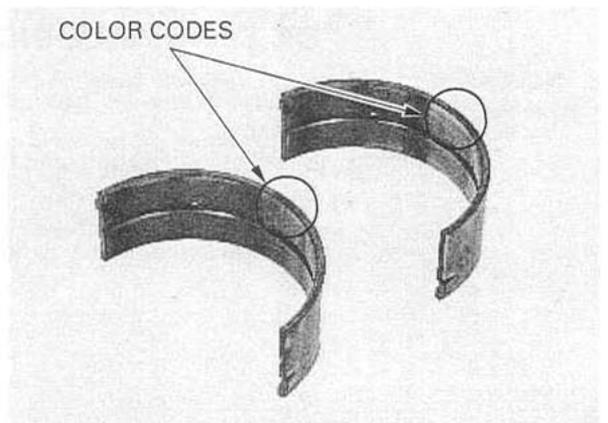

Letter A, B or C on the left side of the upper crankcase is the code for the bearing support I.D. Record the crankcase bearing support I.D. code letters.

Cross reference the main journal and bearing support codes to determine the replacement bearing color code.

Bearing support I.D. code \ Main journal O.D. code	A	B	C
1	Yellow	Green	Brown
2	Green	Brown	Black
3	Brown	Black	Blue

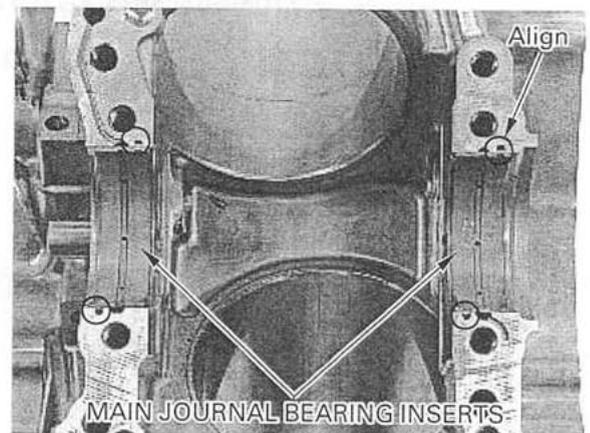

CRANKSHAFT/PISTON/CYLINDER

After selecting new bearings, recheck the oil clearance with plastigauge. Incorrect oil clearance can cause major engine damage.

BEARING INSTALLATION

Clean the bearing outer surfaces and crankcase bearing supports.

Install the main journal bearing inserts onto the crankcase bearing supports, aligning each tab with each groove.

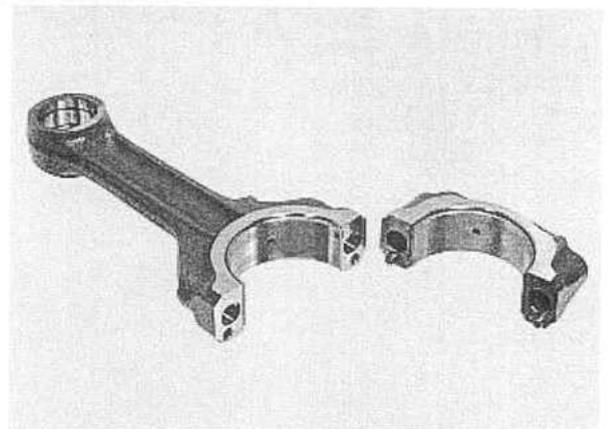

CRANKPIN BEARING

Remove the crankshaft (page 12-3).

BEARING INSPECTION

Check the bearing inserts for unusual wear or peeling.

Check the bearing tabs for damage.

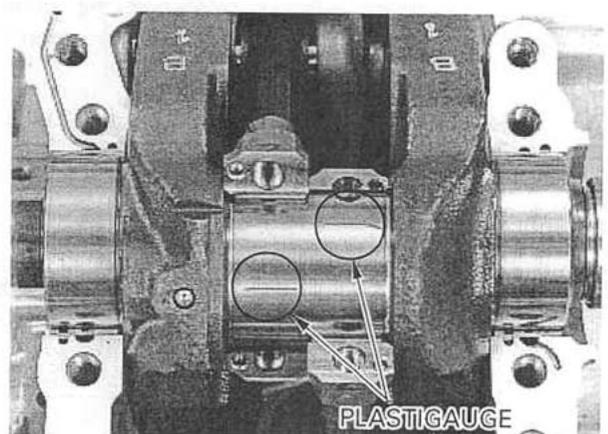

OIL CLEARANCE INSPECTION

Do not rotate the crankshaft during inspection.

Clean off any oil from the bearing inserts and crankpin.

Install the crankshaft onto the upper crankcase. Set the connecting rods onto the crankpin.

Put strips of plastigauge lengthwise on the crankpin avoiding the oil hole.

CRANKSHAFT/PISTON/CYLINDER

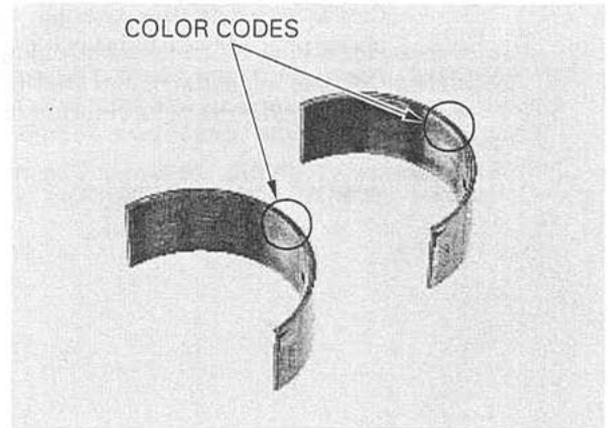

Cross reference the connecting rod and crankpin codes to determine the replacement bearing color code.

Connecting rod I.D. code Crankpin O.D. code	1	2	3
A	Yellow	Green	Brown
B	Green	Brown	Black
C	Brown	Black	Blue

NOTE:

- There is one painted mark on the bearing insert for the front connecting rod, and two painted marks for the rear connecting rod. Use correct bearing inserts.

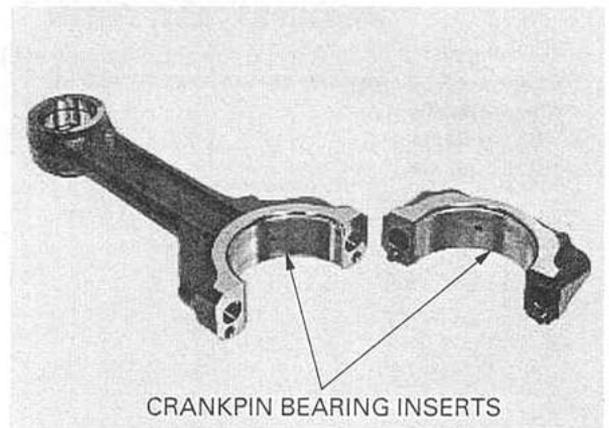

After selecting new bearings, recheck the oil clearance with plastigauge. Incorrect oil clearance can cause major engine damage.

BEARING INSTALLATION

Clean the bearing outer surfaces, bearing cap and connecting rod.

Install the crankpin bearing inserts onto the bearing cap and connecting rod aligning each tab with each groove.

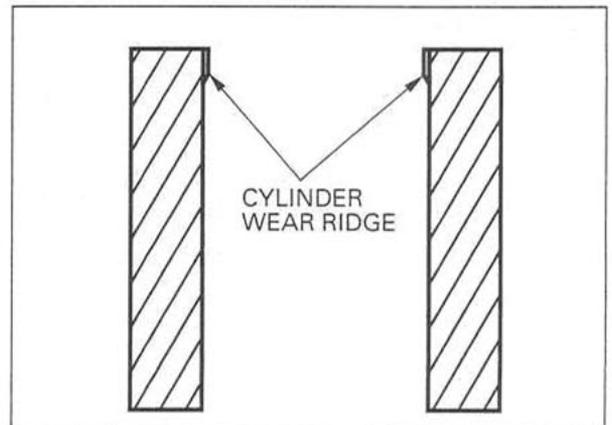

PISTON/CYLINDER

PISTON REMOVAL

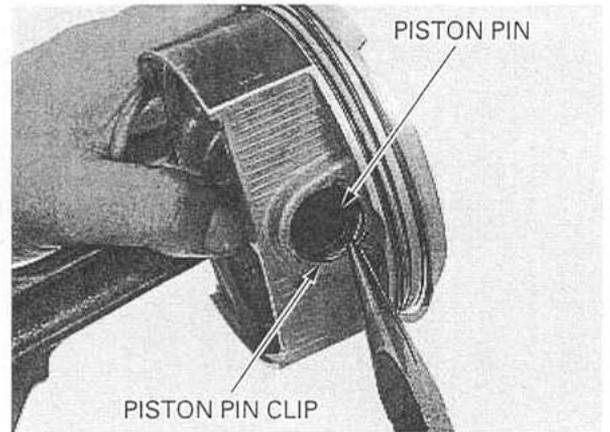

Remove the transmission (page 11-5).
Remove the crankshaft (page 12-3).

Any ridge on the cylinder must be removed with an automotive type ridge reamer before removing the pistons.

Push each piston/connecting rod out through the top of the cylinder bore.

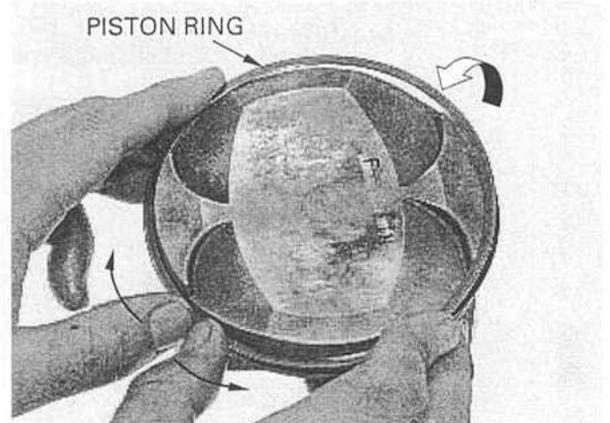

Remove the piston pin clips with the pliers. Push the piston pin out of the piston and connecting rod, and remove the piston.

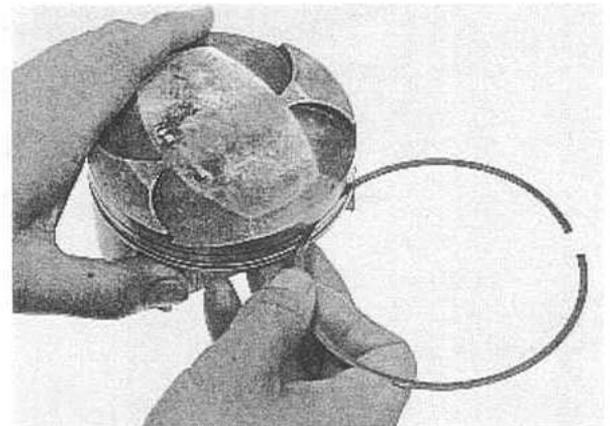

PISTON RING REMOVAL

Do not damage the piston ring by spreading the ends too far. Spread each piston ring and remove it by lifting up at a point opposite the gap.

Never use a wire brush; it will scratch the groove. Clean carbon deposits from the piston ring grooves with a ring that will be discarded.

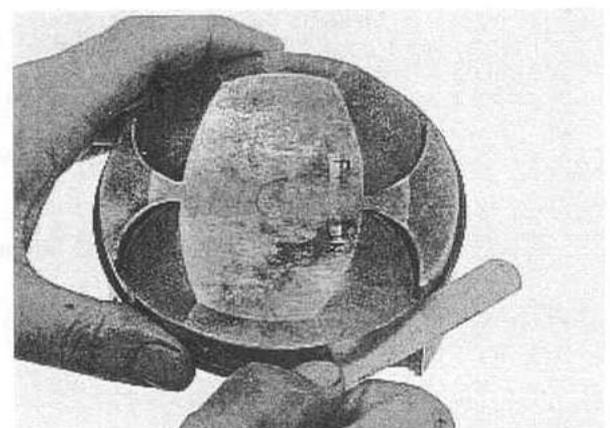

PISTON INSPECTION

Inspect the piston rings for movement by rotating the rings. The rings should be able to move in their grooves without catching.

Push the ring until the outer surface of the piston ring is nearly flush with the piston and measure the ring-to-ring groove clearance.

NOTE:

- Make sure the piston pin clips are seated securely.
- Do not align the piston pin clip end gap with the piston cutout.

Remove and discard the bearings if the races do not turn smoothly and quietly, or if they fit loosely in the hub.

DISASSEMBLY

Remove the dust seals from the wheel hub.
Remove the disc bolts and brake discs from the wheel hub.

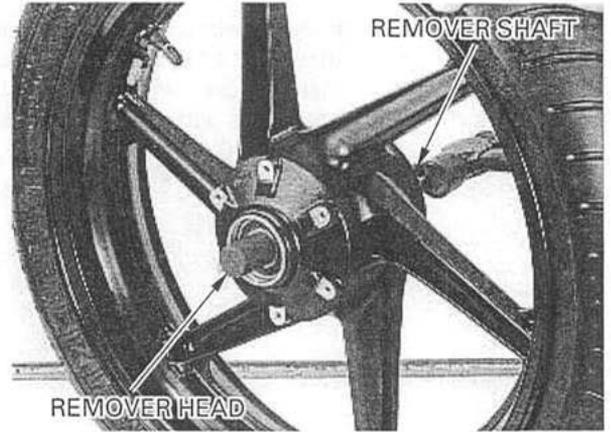

Replace the wheel bearings in pairs. Do not reuse old bearings.

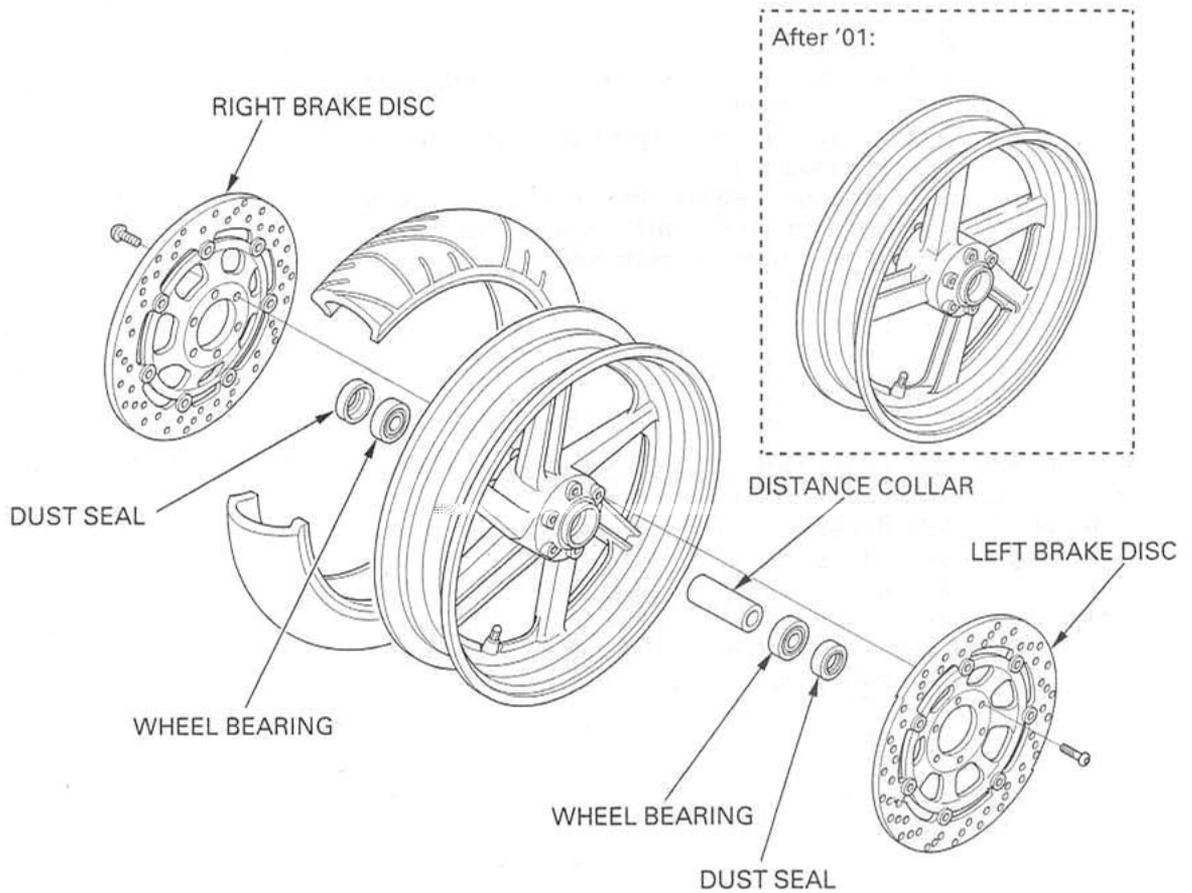

Install the bearing remover head into the bearing. From the opposite side, install the bearing remover shaft and drive the bearing out of the wheel hub. Remove the distance collar and drive out the other bearing.

TORQUE: 20 N·m (2.0 kgf·m , 14 lbf·ft)

WHEEL BALANCE

NOTE:

- Mount the tire with the arrow mark facing in the direction of rotation.
- The wheel balance must be checked when the tire is remounted.
- For optimum balance, the tire balance mark (a paint dot on the side wall) must be located next to the valve stem. Remount the tire if necessary.

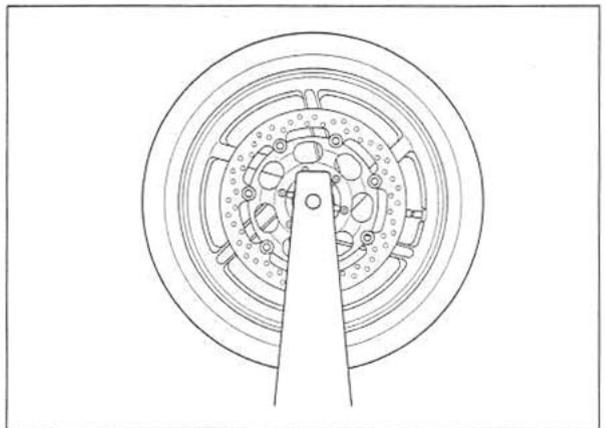

Wheel balance directly affects the stability, handling and overall safety of the motorcycle. Carefully check balance before reinstalling the wheel.

Mount the wheel, tire and brake disc assembly on an inspection stand.

Spin the wheel, allow it to stop, and mark the lowest (heaviest) part of the wheel with chalk.

Do this two or three times to verify the heaviest area.

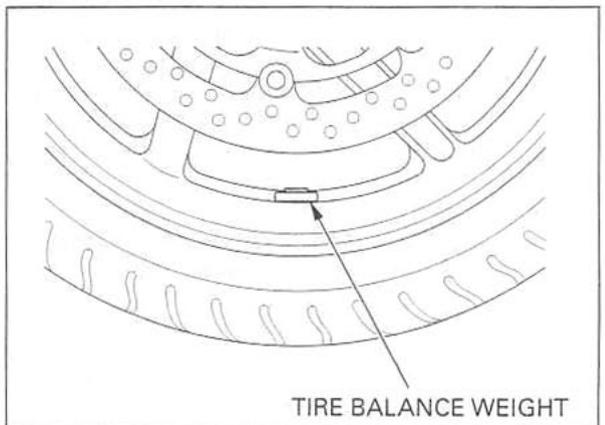

If wheel is balanced, it will not stop consistently in the same position.

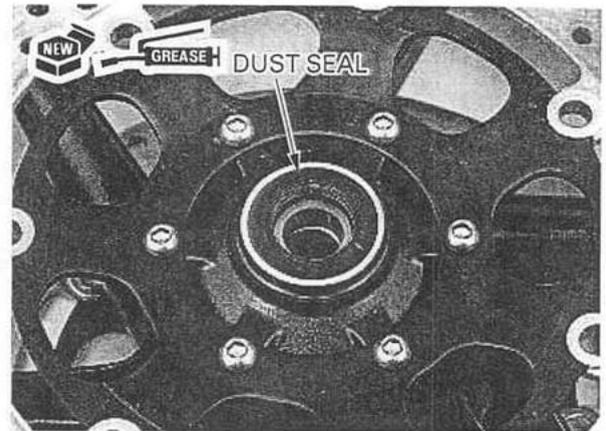

To balance the wheel, install balance weights on the lightest side of rim, the side opposite the chalk mark.

Adjust enough weight so the wheel will no longer stop in the same position when it is spun.

Do not add more than 60 g (2.1 oz) to the wheel.

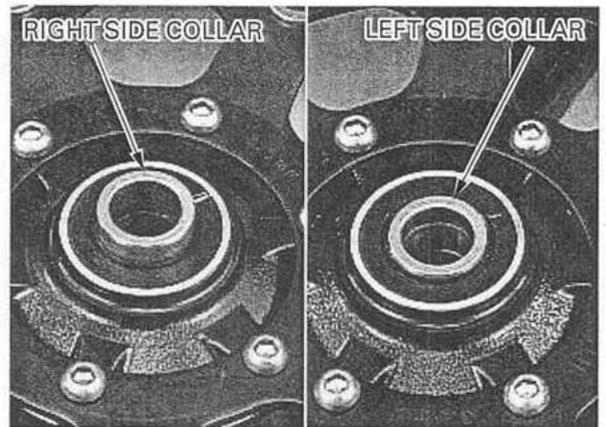

Apply grease to new dust seal lips.
Install the dust seals into the wheel hub.

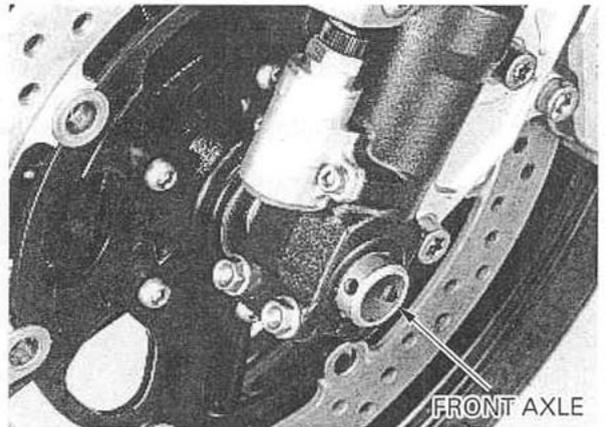

INSTALLATION

The right side collar is longer than the left side collar.

SERVICE INFORMATION

GENERAL

- A hoist or equivalent is required to support the motorcycle when servicing the rear wheel and suspension.
- The shock absorber contains nitrogen gas under high pressure. Do not allow fire or heat near the shock absorber.
- Before disposal of the shock absorber, release the nitrogen.
- The damper unit is filled with nitrogen gas under high pressure, do not try to disassemble.
- Use genuine Honda replacement bolts and nuts for all suspension pivots and mounting points.
- When using the lock nut wrench for the adjusting bolt lock nut, use a 20-inch long deflecting beam type torque wrench. The lock nut wrench increases the torque wrench's leverage, so the torque wrench reading will be less than the torque actually applied to the lock nut. The specification given is the actual torque applied to the lock nut, not the reading on the torque wrench. Do not overtighten the lock nut. The specification later in the text gives both actual and indicated.
- Refer to section 15 for brake system service.

SERVICE INFORMATION

GENERAL

⚠ CAUTION

Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.

- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an OSHA-approved vacuum cleaner.

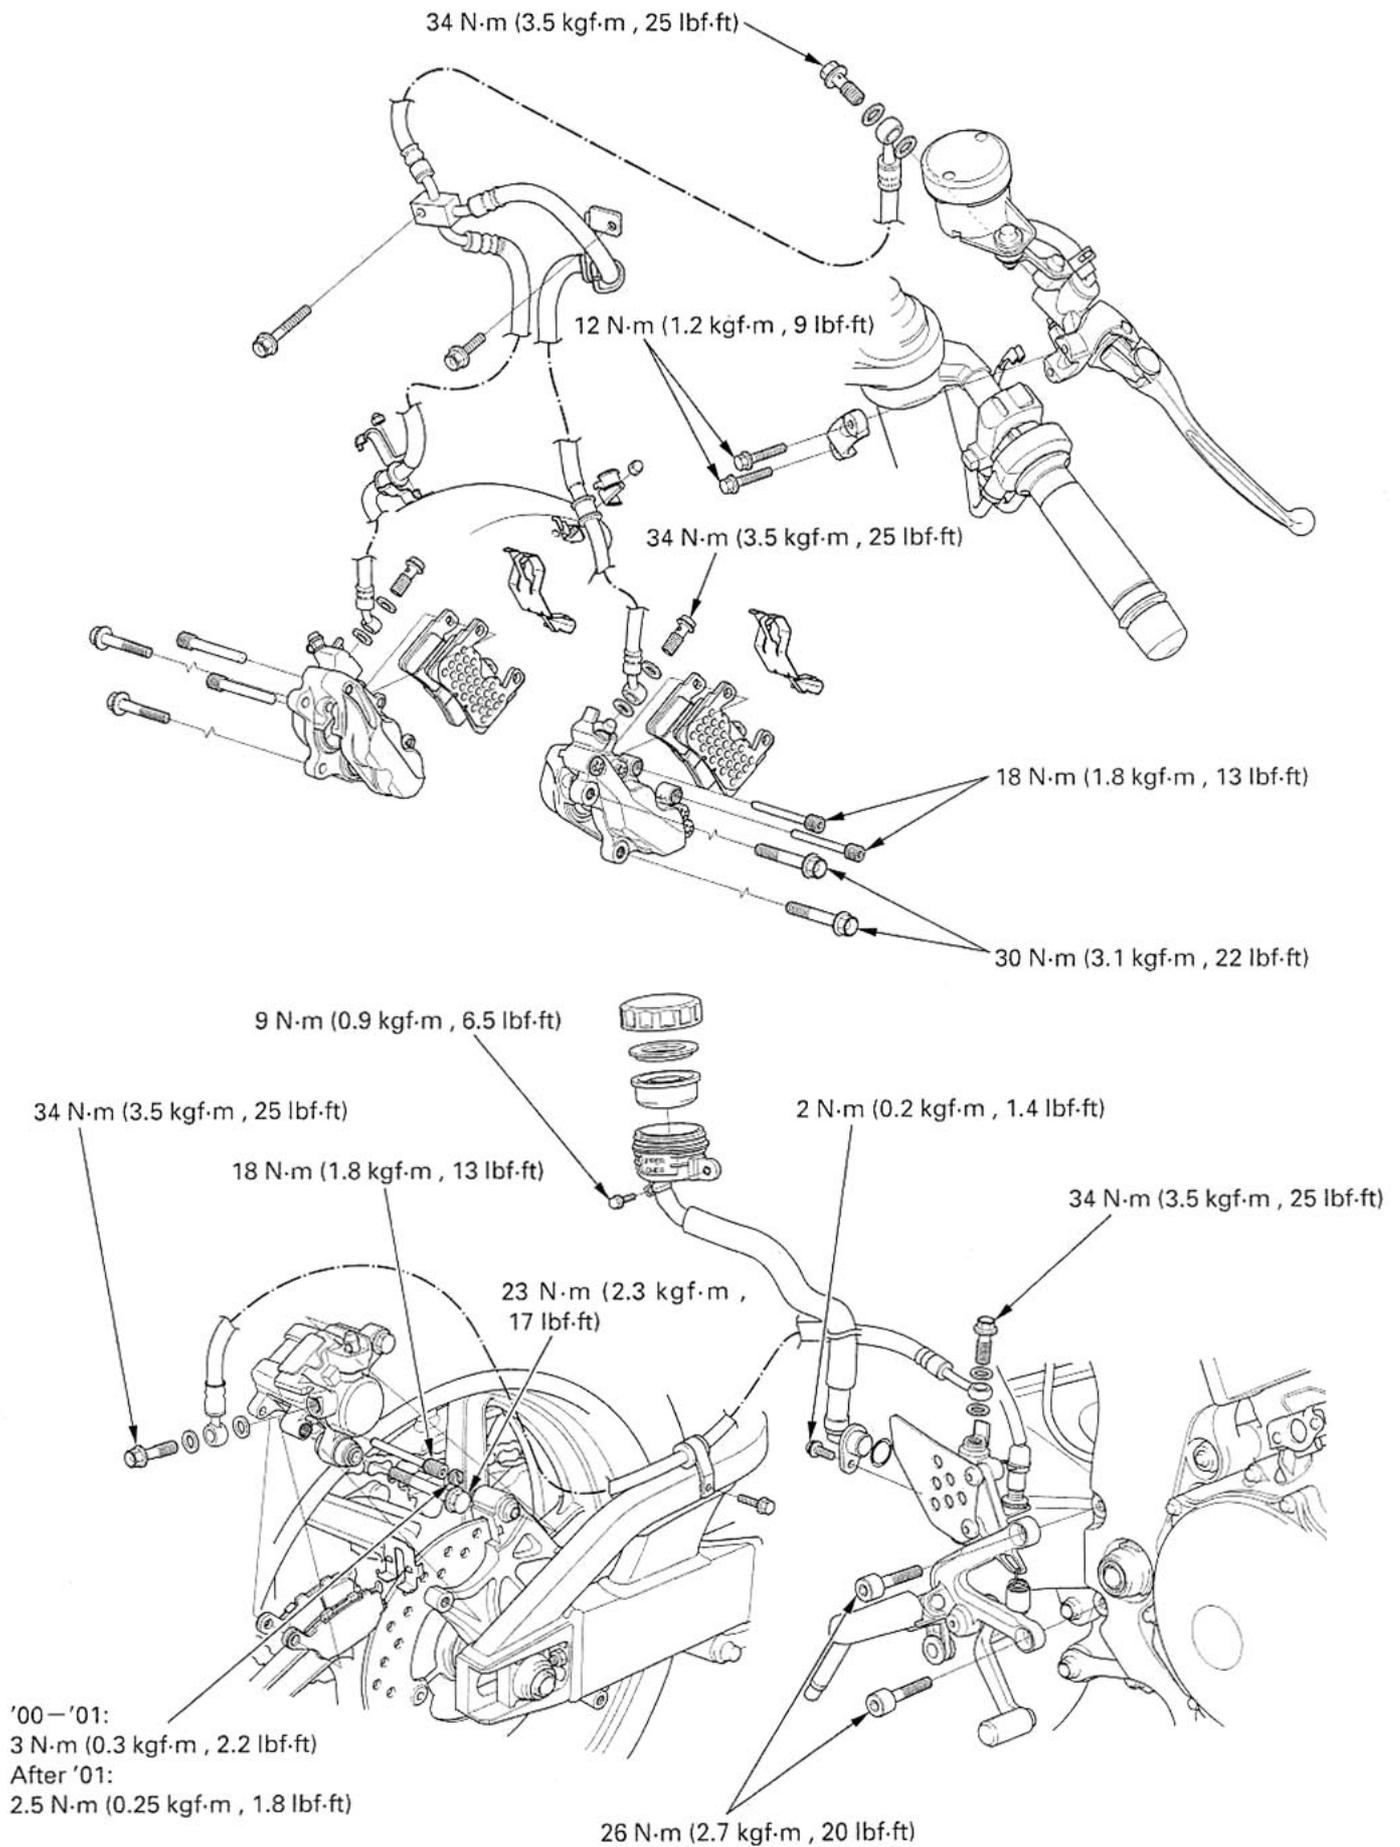

- A contaminated brake disc or pad reduces stopping power. Discard contaminated pads and clean a contaminated disc with a high quality brake degreasing agent.
- Spilled brake fluid will severely damage the plastic parts and painted surfaces. It is also harmful to some rubber parts. Be careful whenever you remove the reservoir cap; make sure the reservoir is horizontal first.
- Never allow contaminants (dirt, water, etc.) to get into an open reservoir.
- Once the hydraulic system has been opened, or if the brake feels spongy, the system must be bled.
- Always use fresh DOT 4 brake fluid from a sealed container when servicing the system. Do not mix different types of fluid as they may not be compatible.
- Always check brake operation before riding the motorcycle.

BATTERY

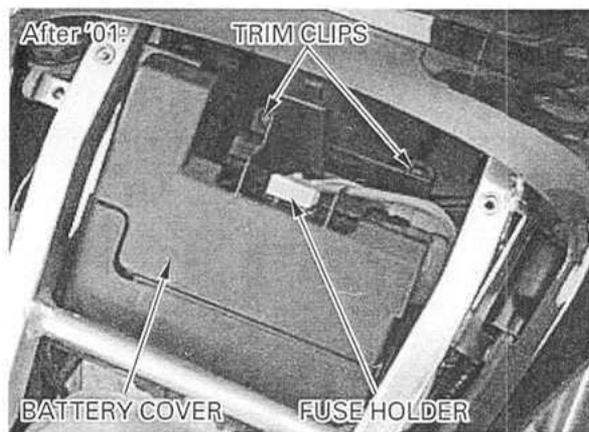

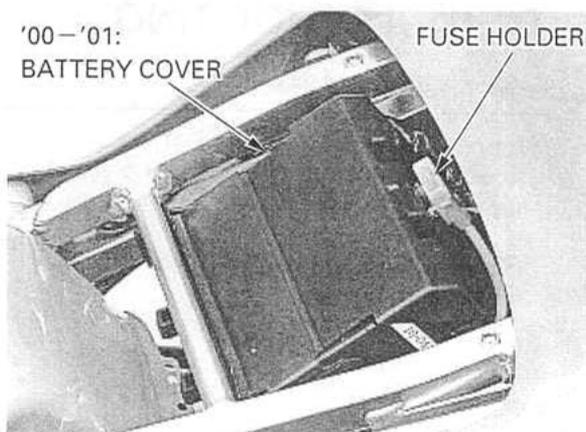

REMOVAL/INSTALLATION

Remove the rider seat (page 2-2).

Remove the PGM-FI fuse holder from the battery cover.

'00-'01: Open the battery cover by releasing the two lock tabs and two hinge tabs, and remove the cover from the battery case of the rear fender.

After '01: Open the battery cover by removing the two trim clips.

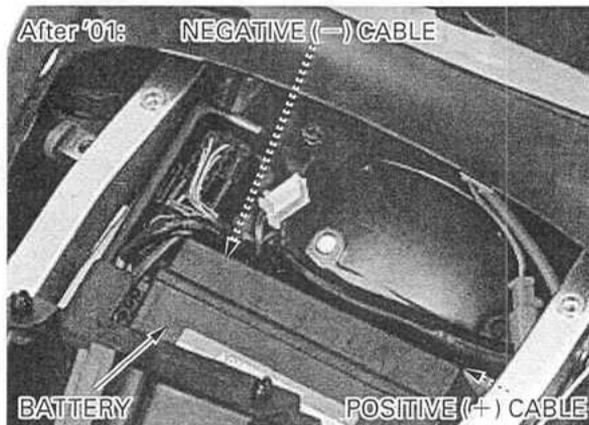

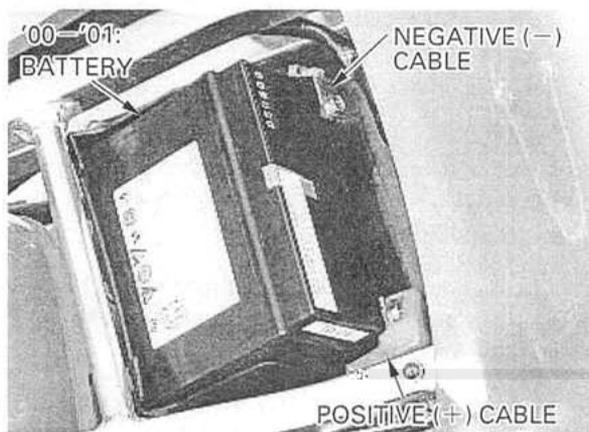

Raise the battery and with the ignition switch turned to "OFF", disconnect the negative (-) cable first, then disconnect the positive (+) cable. Remove the battery from the battery case.

Install the battery in the reverse order of removal.

NOTE:

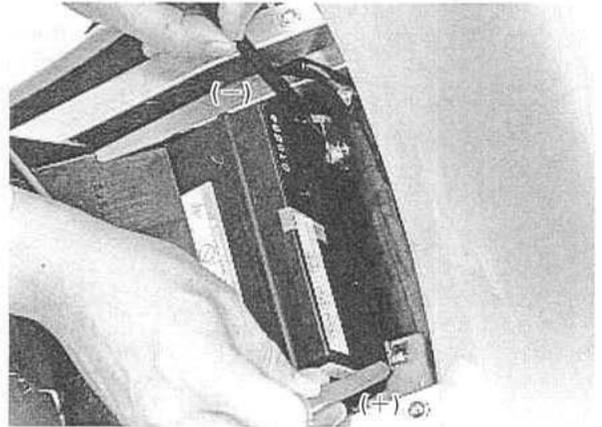

- Connect the positive (+) cable first, then connect the negative (-) cable.
- After connecting the battery cables, coat the terminals with dielectric grease.

VOLTAGE INSPECTION

Open the battery cover.
 Measure the battery voltage using a commercially available digital multimeter.

VOLTAGE (20°C/68°F): Fully charged: 13.0 – 13.2 V
Under charged: Below 12.3 V

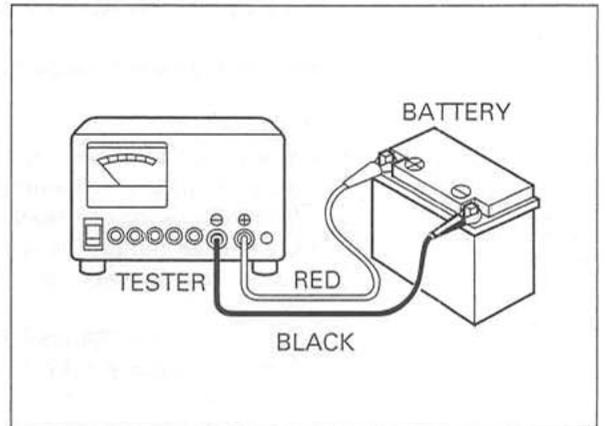

BATTERY TESTING

Remove the battery (page 16-4).

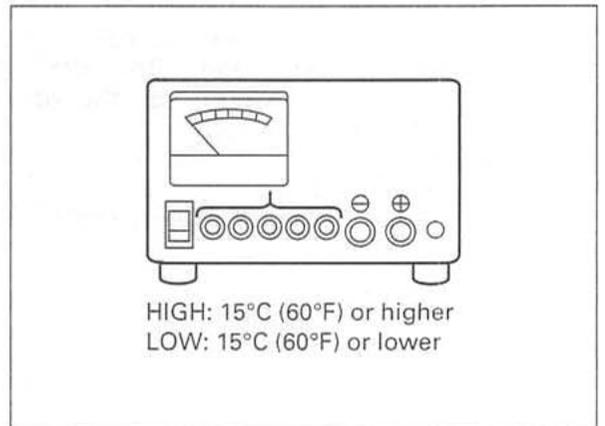

For accurate test results, be sure the tester's cables and clamps are in good working condition and that a secure connection can be made at the battery.

Securely connect the tester's positive (+) cable first, then connect the negative (-) cable.

TOOL:
Battery tester BM-210-AH or BM-210 (U.S.A only)

Set the temperature switch to "HIGH" or "LOW" depending on the ambient temperature.

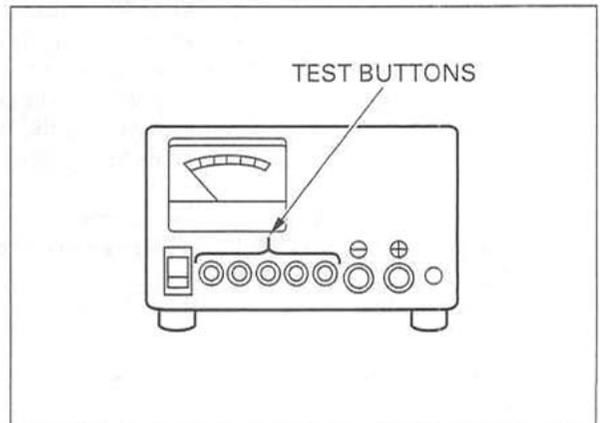

For the first check, DO NOT charge the battery before testing; test it in an "as is" condition.

Push in the appropriate test button for 3 seconds and read the condition of the battery on the meter.

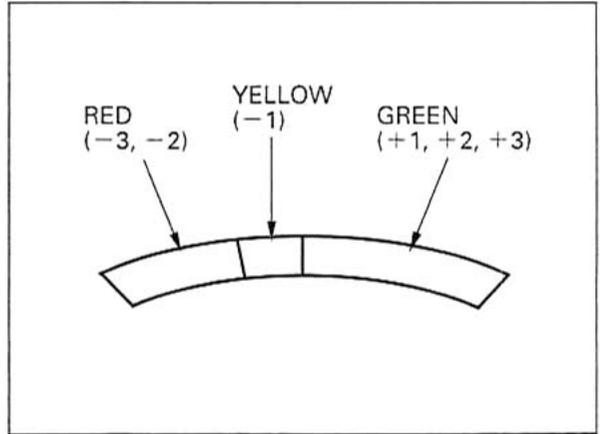

NOTICE

- To avoid damaging the tester, only test batteries with an amperage rating of less than 30 Ah.
- Tester damage can result from overheating when:
 - The test button is pushed in for more than 3 seconds.
 - The tester is used without being allowed to cool for at least 1 minute when testing more than one battery.
 - More than ten consecutive tests are performed without allowing at least a 30-minute cool-down period.

BATTERY/CHARGING SYSTEM

The result of a test on the meter scale is relative to the amp. hour rating of the battery. Any battery reading in the green zone is OK. Batteries should only be charged if they register in the YELLOW or RED zone.

BATTERY CHARGING

Remove the battery (page 16-4).

NOTE:

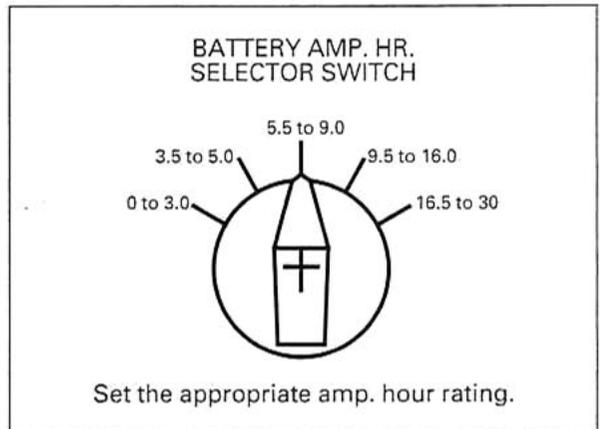

- Make sure the area around the charger is well ventilated, clear of flammable materials, and free from heat, humidity, water and dust.
- Clean the battery terminals and position the battery as far away from the charger as the leads will permit.
- Do not place batteries below the charger-gases from the battery may corrode and damage the charger.
- Do not place batteries on top of the charger. Be sure the air vents are not blocked.

1. Turn the "POWER" switch to "OFF."
2. Set the "BATTERY AMP. HR. SELECTOR SWITCH" for the size of the battery being charged.

Turn the power ON/OFF at the charger, not at the battery terminals.

TOOL:

Christie battery charger MC1012/2 (U.S.A. only)

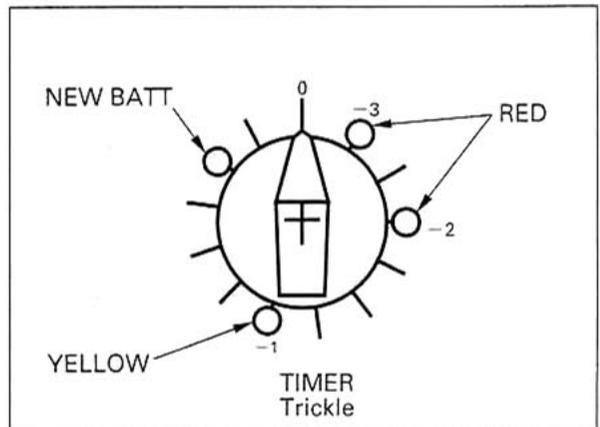

Set the appropriate amp. hour rating.

3. Set the "TIMER" to the position indicated by the Honda Battery Tester; RED-3, RED-2 or YELLOW 1. if you are charging a new battery, set the switch to the NEW BATT position.
4. Attach the clamps to the battery terminals: red to positive, black to negative.

Connecting the cables with the POWER switch turned to "ON" can produce a spark which could ignite or explode the battery.

Connect the battery cables only when the "POWER" switch is turned to "OFF."

CHARGING VOLTAGE INSPECTION

NOTE:

- Be sure the battery is in good condition before performing this test.

Start the engine and warm it up to the operating temperature; stop the engine.

Connect the multimeter between the positive and negative terminals of the battery.

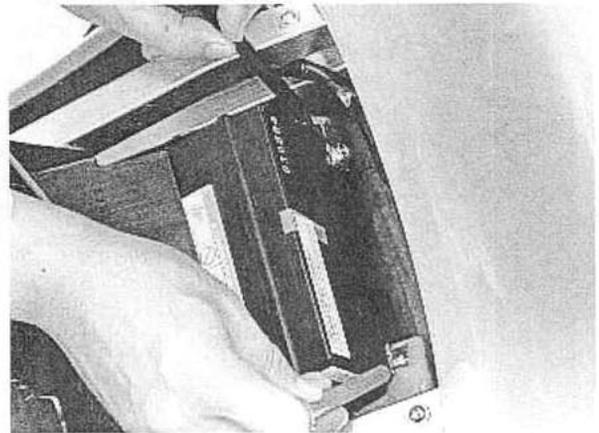

NOTE:

- To prevent a short, make absolutely certain which are the positive and negative terminals or cable.
- Do not disconnect the battery or any cable in the charging system without first switching off the ignition switch. Failure to follow this precaution can damage the tester or electrical components.

With the headlight on high beam, restart the engine. Measure the voltage on the multimeter when the engine runs at 5,000 rpm.

STANDARD:

Measured battery voltage (page 16-5) < Measured charging voltage (see above) < 15.5 V

ALTERNATOR CHARGING COIL INSPECTION

Remove the seat cowl (page 2-2).

Disconnect the alternator 3P (white) connector.

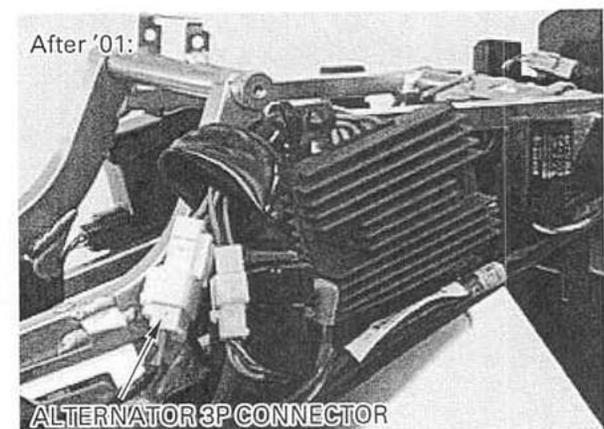

Measure the resistance between the wire terminals of the alternator side connector.

STANDARD: 0.2–0.5 Ω (20°C/68°F)

Check for continuity between each wire terminal of the alternator side connector and ground. There should be no continuity.

Replace the alternator stator if resistance is out of specification, or if any wire has continuity to ground.

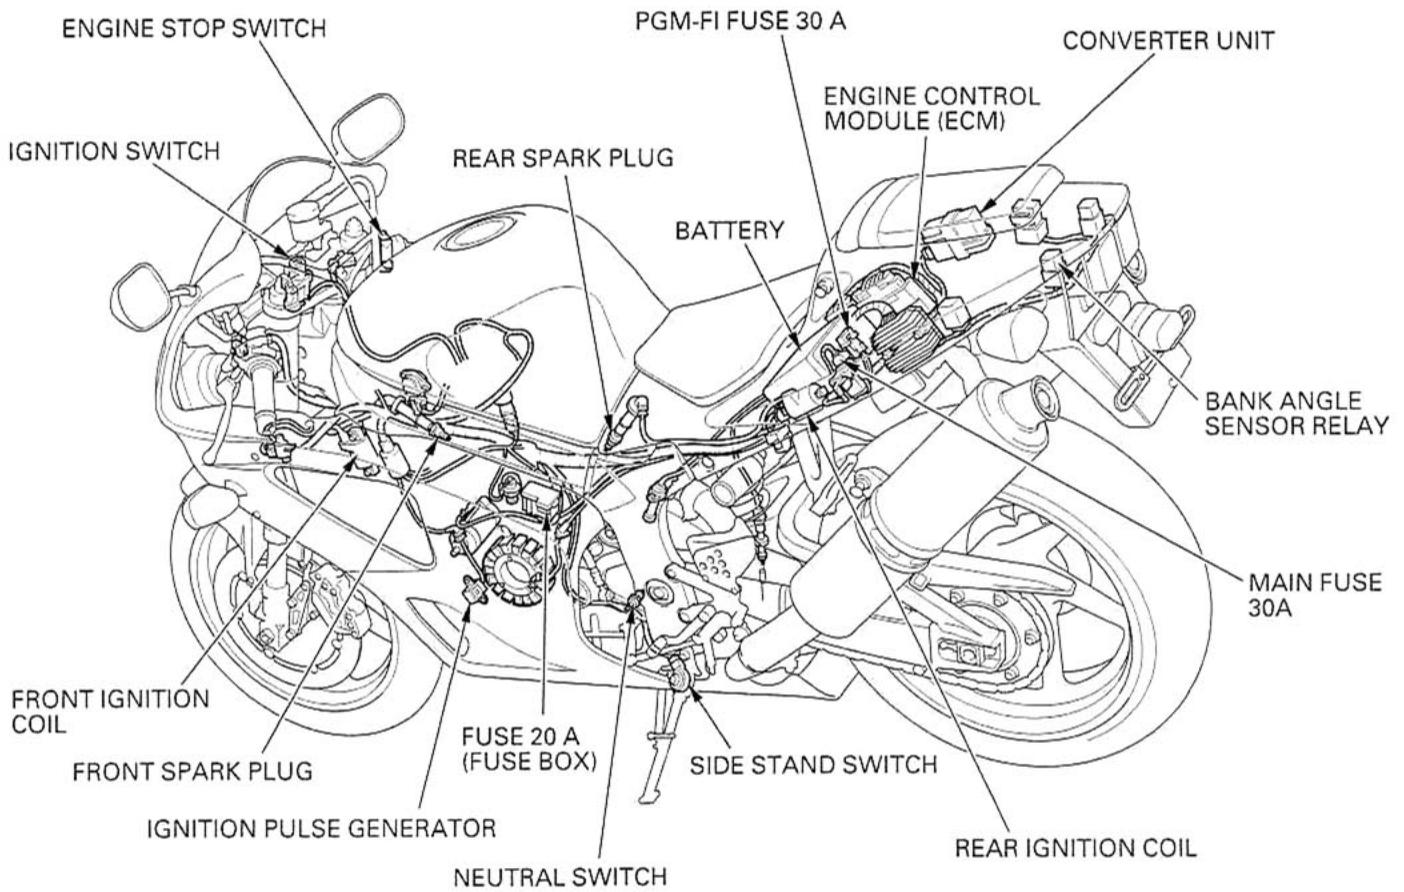

Refer to section 10 for alternator stator replacement.

SERVICE INFORMATION

GENERAL

- Some electrical components may be damaged if terminals or connectors are connected or disconnected while the ignition switch is turned to "ON" and current is present.
- When servicing the ignition system, always follow the steps in the troubleshooting sequence on page 17-3.
- This motorcycle's Ignition Control Module (ICM) is built in the Engine Control Module (ECM).
- The transistorized ignition system uses an electrically controlled ignition timing system. No adjustments can be made to the ignition timing.
- The ECM varies ignition timing according to the engine speed.
- The ECM may be damaged if dropped. Also, if the connector is disconnected when current is flowing, the excessive voltage may damage the ECM. Always turn off the ignition switch before servicing.
- A faulty ignition system is often related to poor connections. Check those connections before proceeding.
- Make sure the battery is adequately charged. Using the starter motor with a weak battery results in a slower engine cranking speed as well as no spark at the spark plugs.
- This motorcycle's spark plugs are equipped with iridium type electrodes. Do not use spark plugs other than specified.
- For spark plug inspection, see section 3.
- See section 19 for following components:
 - Ignition switch
 - Engine stop switch
 - Neutral switch
 - Side stand switch
 - Clutch switch
 - Diode

Install the brush holder, aligning the holder tab with the case groove, and the holder grooves with the insulated brush wires.

The coil may be damaged if the magnet pulls the armature against the case.

Push and hold the brushes inside the brush holder, and install the armature through the motor case and brush holder.

When installing the armature into the motor case, hold the armature tightly to keep the magnet of the case from pulling the armature against it.

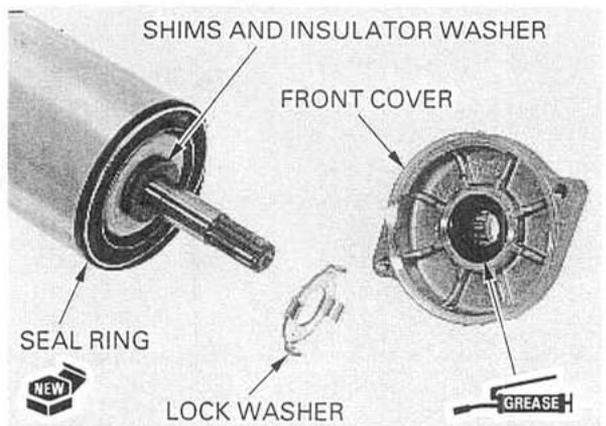

Install the shims and insulated washer onto the armature shaft.

If there is continuity when the transmission is in neutral or when the clutch is disengaged and the side stand is retracted, the ground circuit is normal. (In neutral, there is a slight resistance due to the diode.)

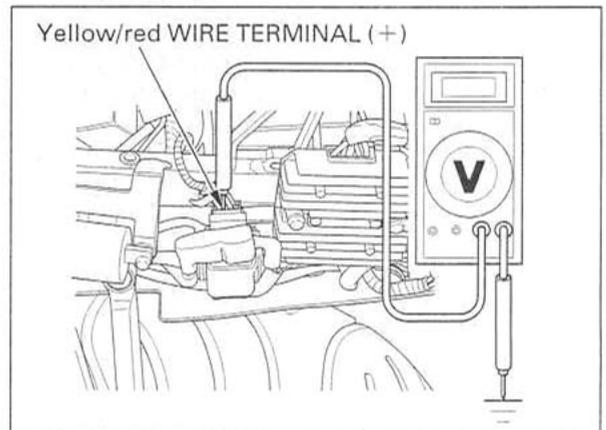

STARTER RELAY VOLTAGE

Connect the starter relay switch 4P connector.

Shift the transmission into neutral.

Measure the voltage between the yellow/red wire terminal (+) and ground (-).

If the battery voltage appears only when the starter switch is pushed with the ignition switch ON, it is normal.

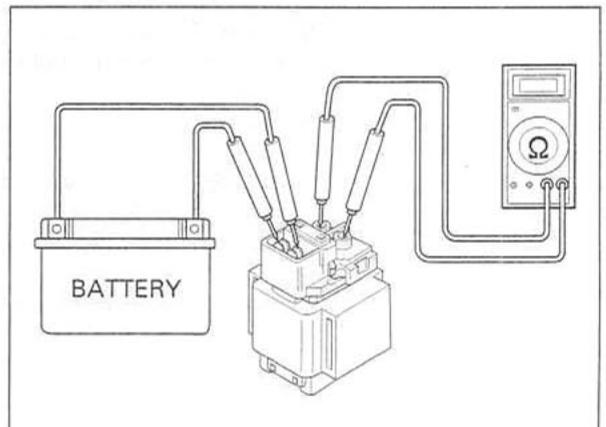

OPERATION CHECK

Disconnect the starter relay switch 4P connector and cables.

Connect a fully charged 12 V battery positive wire to the relay switch yellow/red wire terminal and negative wire to the green/red wire terminal.

There should be continuity between the large terminals while the battery is connected, and no continuity when the battery is disconnected.

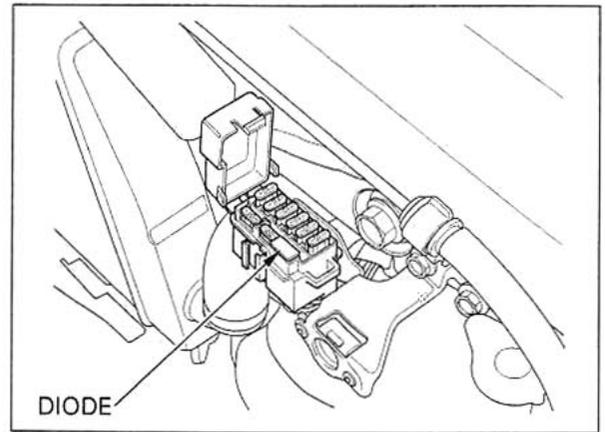

DIODE

INSPECTION
